Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.005$ Å;
 R factor = 0.056; wR factor = 0.121; data-to-parameter ratio = 16.5.

In the title coordination compound, $\{[Zn(C_{14}H_{14}N_4)_2](NO_3)_2 \cdot CH_3OH\}_n$, the cationic complex forms a looped chain containing 24-membered M_2L_2 rings. The ligand adopts two distinct conformations that are alternated in subsequent loops. The Zn^{II} ion displays a slightly distorted tetrahedral geometry being coordinated by four N atoms from four 1,3-bis(imidazol-1-ylmethyl)benzene ligands. The nitrate ions and methanol solvent molecules are located between adjacent double-stranded chains and participate in an extensive net of O—H···O and C—H···O hydrogen bonds. The resulting three-dimensional assembly is further stabilized by π – π interactions between benzene rings [centroid–centroid distances = 3.878 (2) and 3.853 (2) Å].

S1. Comment

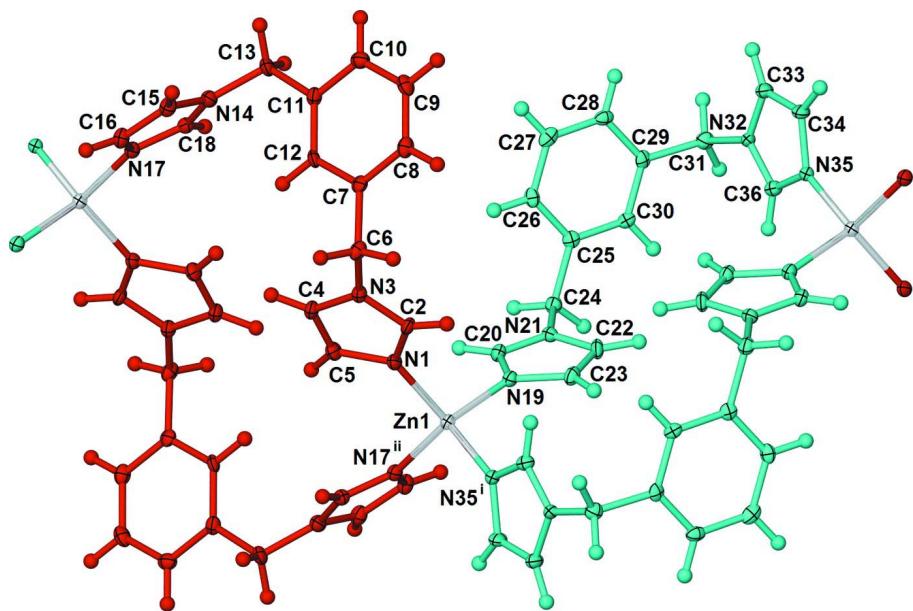

During the course of ongoing studies on metal complexes of ditopic imidazole based ligands (Dobrzańska *et al.*, 2007; Dobrzańska *et al.*, 2006) the title coordination compound (I) was isolated. It consists of infinite cationic double-stranded chains running parallel to [-1 - 1 1], nitrate counterions and methanol molecules. An interesting feature of I is the presence of two different conformers of the 1,3-bis(imidazol-1-ylmethyl)benzene ligand in the asymmetric unit simultaneously with N3—C6—C13—N14 and N21—C24—C31—N32 torsion angles of 70.4 (2) and 12.2 (3)°, respectively. These ligands are bridging Zn^{II} centres by imidazole N-atoms to form cationic looped chains, whereby each loop consists of only one type of conformers (Fig. 1), leading to alternating Zn···Zn distances with values of 9.930 (2) and 9.952 (2) Å. Similar one-dimensional double-stranded motifs were observed in the case of Cu(II) complexes with the same ligand and counterions such as Cl[−], Br[−], NO₃[−] (see compounds 2, 3, 6, 7 in Dobrzańska *et al.*, 2008) and for a Cd(II) complex with Cl[−] counterions (Li & Du, 2006). However, in none of these cases two distinct conformers of the ligand were present in a single chain. Furthermore it is worth noting that the corresponding N—C—C—N torsion angles for these reported compounds never exceeded 30°. Each zinc(II) ion in the chain shows a slightly deformed tetrahedral geometry with N—Zn—N bond angles in the range of 106.22 (10) – 114.88 (11)° (Table 1). Zn—N bond lengths are in good agreement with those reported for related tetrahedral zinc(II) complexes (Hoskins *et al.*, 1997; Chawla *et al.*, 2006). The position of the imidazole units in the M₂L₂ rings prevents accommodating any guest molecules inside of the ring spaces formed. Thus nitrate counterions and methanol molecules occupy the spaces between adjacent chains. Both have all of their oxygen atoms participating in an extensive net of hydrogen bonds (Table 2) leading to the formation of a three-dimensional assembly, further stabilized by C—H···π (Table 2) and π···π stacking interactions between benzene rings from adjacent chains [symmetry code: -x, 1 - y, -z, centroid-centroid distance = 3.878 (2) Å with *ca* 1.05 Å slippage for ring C7—C12 and symmetry code: -x, 1 - y, 1 - z, centroid-centroid distance = 3.853 (2) Å with *ca* 2.13 Å slippage for ring C25—C30] (Fig. 2).

S2. Experimental

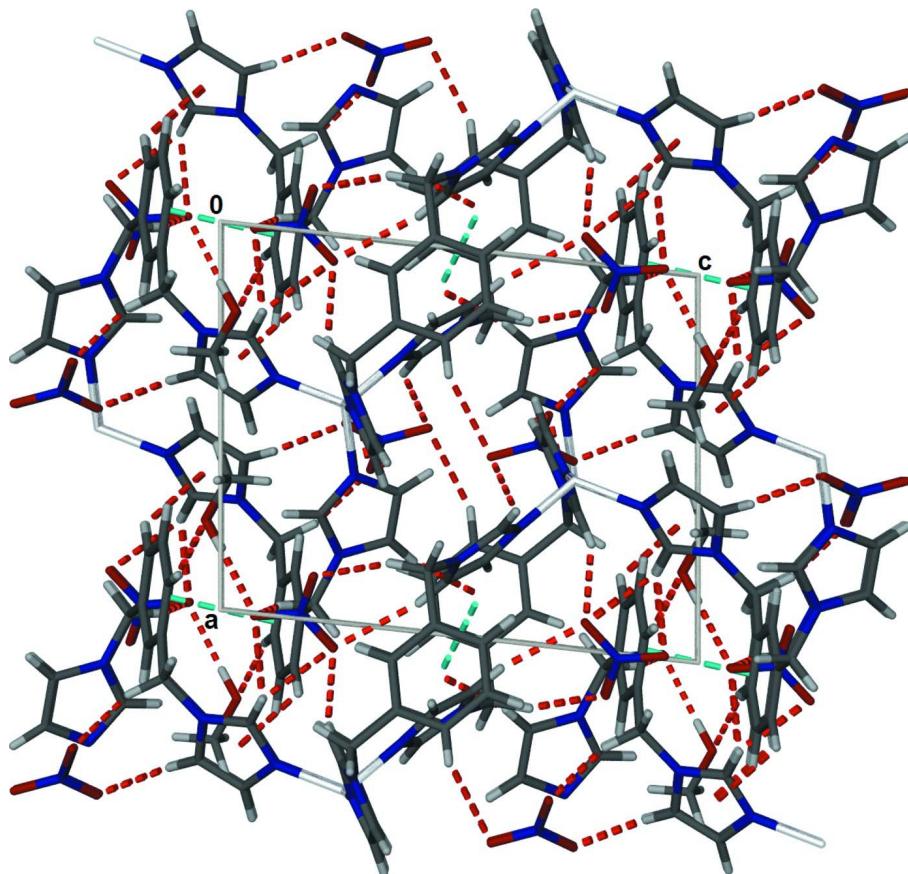

A methanolic solution of Zn(NO₃)₂·4H₂O was added to a methanolic solution of 1,3-bis(imidazol-1-ylmethyl)benzene in a 1:2 molar ratio. Colorless crystals suitable for single-crystal X-ray diffraction were obtained by slow evaporation.

S3. Refinement

H atoms were positioned geometrically, with C—H = 0.95 (aromatic), 0.98 (methyl), 0.99 (methylene) and O—H = 0.84 Å, and refined as riding on their parent atoms with U_{iso}(H) = 1.5U_{eq}(C) for methyl H and 1.2U_{eq}(C,O) for all other H.

**Figure 1**

Fragment of an infinite cationic chain, with the atom-numbering scheme. The alternating loops, represented in red and blue, are formed by different conformations of the ligand [symmetry codes:(i) $-x, -y, -z + 1$; (ii) $-x + 1, -y + 1, -z$]. Displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

Packing diagram of (I) viewed down [010] showing an extensive net of hydrogen bonds (red dashed lines). Blue dashed lines show π - π stacking interactions.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
