Received 27 September 2009; accepted 1 October 2009

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.042; wR factor = 0.105; data-to-parameter ratio = 13.8.

In the crystal structure of the title compound, $[\text{Co}(\text{H}_2\text{O})_6]\cdot[\text{Cu}(\text{C}_{12}\text{H}_{11}\text{N}_2\text{O}_5)]_2\cdot6\text{H}_2\text{O}$, the Co^{II} atom is located on an inversion center and coordinated by six water molecules in a slightly distorted octahedral geometry. The Cu^{II} atom is chelated by the Schiff base ligand in a distorted CuN_2O_2 square-planar geometry. An extensive $\text{O}-\text{H}\cdots\text{O}$ hydrogen-bonding network is present in the crystal structure.

Hexaaquacobalt(II) bis{[N-(4-methoxy-2-oxidobenzylidene)glycylglycinato]copper(II)} hexahydrate

Gan-Bing Yao, Jia-Xun Jiang, Li-Min Yuan and Xiao-Ming Ren

S1. Comment

In recent years, the design and synthesis of Schiff base complexes caused an increasing interest in coordination chemistry because they were potential optical, magnetic materials (Ion *et al.*, 2009; Wu *et al.*, 2007; Costes *et al.*, 2006; Akine *et al.*, 2008). Now, we present the synthesis and structure analysis of the title Schiff base complex derived from 4-methoxy-salicylaldehyde and glycylglycine.

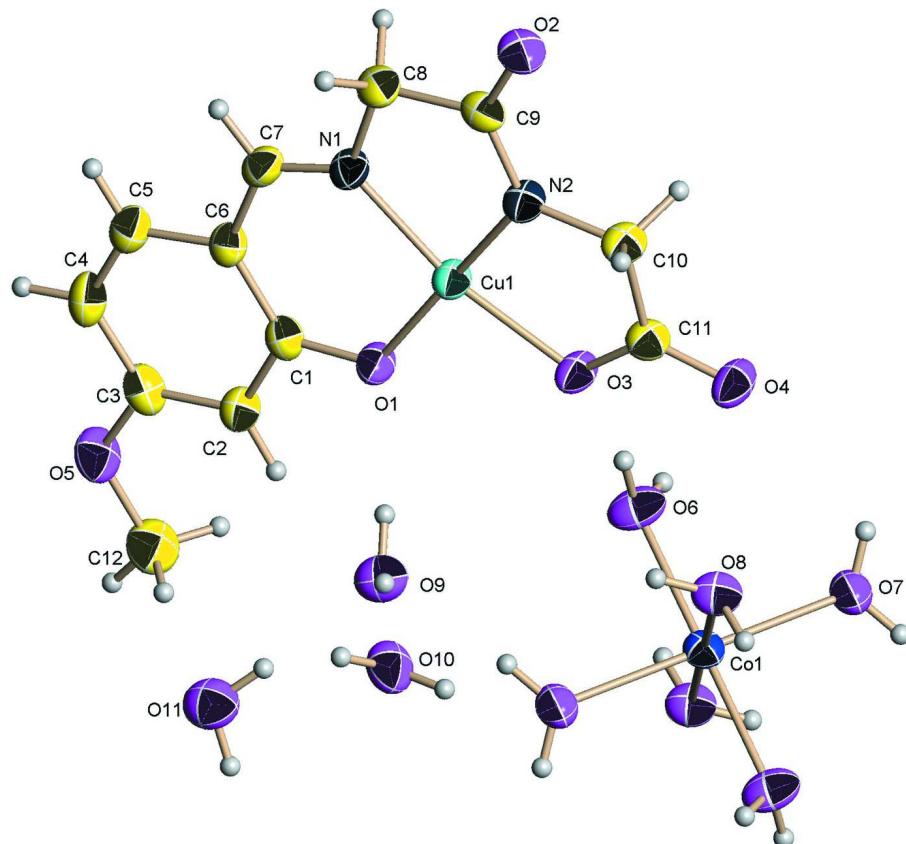

The complex (I) crystallizes in the triclinic space group $P\bar{1}$. The asymmetric unit consists of one $[\text{CuL}]^-$ anion (L is a Schiff base derived from glycylglycine and 4-methoxy-salicylaldehyde), half $\text{Co}(\text{H}_2\text{O})_6^{2+}$ cation [$\text{Co}(1)$, O(6), O(7), O(8)] and three uncoordinated aqua molecules [O(9), O(10), O(11)] in the complex (I) (Fig. 1). The deprotonated Schiff base is a triple negatively charged tetradentate chelate ligand, coordinating to the Cu(II) atom by one phenolate O atom [O(1)], one imine N atom [N(1)], one deprotonated amide N atom [N(2)] and one carboxylato O atom [O(3)]. $[\text{CuL}]^-$ has approximately square-planar structure. The Cu(II) atom is in a slightly distorted square-planar environment with four donor atoms deviating from their mean plane by -0.0503 Å (N(1)), +0.0621 Å (N(2)), +0.0509 Å (O(1)) and -0.0494 Å (O(3)) (observed bond angles vary from 83.4 (1)° and 96.6 (1)°). The benzene ring [C(1)–C(6)] and the [O(1), C(1), C(6), C(7), N(1), Cu(1)] chelate ring are almost coplanar with a small dihedral angle of 0.1 (1)°, suggesting a large π -electron delocalization. The Co(II) atom lies on an inversion center and the coordination by six aqua ligands is slightly distorted octahedral. The six Co—O bonds in the structure are in the range of 2.075 (2) – 2.081 (2) Å. In the crystal structure, the $[\text{CuL}]^-$ anions and $[\text{Co}(\text{H}_2\text{O})_6]^{2+}$ cations form well separated columns along the a -axis, which are further formed a three-dimensional network by hydrogen bonds (Table 1).

S2. Experimental

Glycylglycine (5 mmol), 4-methoxy-salicylaldehyde (5 mmol) and LiOH (10 mmol) were dissolved in MeOH/H₂O (30 ml, v:v = 1:1) and refluxed for 30 min. Then $\text{Cu}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$ (5 mmol) was added to the solution and the resulting solution was adjusted to 9–11 by 5 M NaOH solution. After stirring at room temperature for 1 h, $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$ (2.5 mmol) was added. A violet precipitate was obtained immediately. After stirring for another 30 min and then filtrated, the precipitate was recrystallized from water. The violet crystals suitable for X-ray diffraction were obtained after one week (yield 30% based on $\text{Cu}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$).

S3. Refinement

The water H atoms in (I) were located in a difference Fourier map and refined with a distance restraint of O—H = 0.83–0.85 Å and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. Other H atoms were positioned geometrically and constrained as riding atoms, with C—H distances of 0.93–0.97 Å and $U_{\text{iso}}(\text{H})$ set to 1.2 or $1.5U_{\text{eq}}(\text{C})$ of the parent atom.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
