Received 19 October 2009; accepted 2 November 2009

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ;  $R$  factor = 0.026;  $wR$  factor = 0.057; data-to-parameter ratio = 12.6.

The title complex,  $[\text{Eu}_2(\text{C}_{11}\text{H}_7\text{O}_3)_6(\text{C}_{12}\text{H}_8\text{N}_2)_2]\cdot 2\text{H}_2\text{O}$ , has a centrosymmetric binuclear cage structure in which the two  $\text{Eu}^{\text{III}}$  ions are both nine-coordinated and bridged by 6-hydroxy-1-naphthoate ( $L$ ) ligands, with an  $\text{Eu}\cdots\text{Eu}$  separation of  $4.1594(4)\text{ \AA}$ . The remaining coordination sites are occupied by two N atoms from one 1,10-phenanthroline (phen) and two O atoms from an  $L$  ligand. The six 6-hydroxy-1-naphthoate groups coordinate each  $\text{Eu}^{\text{III}}$  atom in three different ways, namely  $\mu_2\text{-}\eta^1\text{:}\eta^1$ -bridging,  $\mu_1\text{-}\eta^1\text{:}\eta^1$ -chelating, and  $\mu_2\text{-}\eta^1\text{:}\eta^2$ -chelating/bridging modes. Adjacent discrete dinuclear units are linked into a two-dimensional sheet parallel to (011) by intermolecular  $\text{O}-\text{H}\cdots\text{O}$  hydrogen-bonding interactions. The sheets are cross-linked by water molecules, forming a three-dimensional network. In addition,  $\pi\text{-}\pi$  stacking interactions, with a centroid–centroid separation of  $3.547(2)\text{ \AA}$  are observed.

## Tetrakis( $\mu$ -6-hydroxy-1-naphthoato)bis[(6-hydroxy-1-naphthoato)(1,10-phenanthroline)europium(III)] dihydrate

Chun-Sen Liu, Min Hu and Qiang Zhang

### S1. Comment

In recent years, the rational design and synthesis of functional rare-earth (RE) coordination complexes with various N- and/or O-donor ligands has attracted great interest because of not only their fascinating structural diversities but also their potential applications as functional materials, for example, optical materials, electronic materials, catalytic materials, and molecular-based magnets (Bünzli, 2006; Edelmann, 2009; Fang *et al.*, 2006; Li & Yan, 2009; Xu *et al.*, 2009). In this field, the choice of suitable organic ligands favoring structure-specific self-assembly is crucial for the construction of prospective coordination structures with relevant properties and functions. Among various ligands, the versatile carboxylic acid ligands, especially the benzene- and naphthalene-based di- and multi-carboxylic acids, have been well used in the preparation of various rare-earth (RE) complexes owing to their rich coordination modes (Bettencourt-Dias, 2005; Bettencourt-Dias & Viswanathan, 2006; Qu *et al.*, 2005; Serre & Férey, 2002; Yang *et al.*, 2006). However, far less common has been the use of naphthalene-based monocarboxylic acids, such as the acid used herein, 6-hydroxy-1-naphthoic acid (*H*L). Besides, the introduction of 2,2'-bipyridyl-like bidentate chelating molecules (2,2'-bipyridine or 1,10-phenanthroline) into the reaction systems including various carboxylic acid ligands, as auxiliary ligands, can generate some interesting coordination architectures (Ye *et al.*, 2005). We report here the crystal structure of the title complex (I), a Eu<sup>III</sup> complex with mixed 6-hydroxy-1-naphthoic acid (*L*) and chelating 1,10-phenanthroline (phen) ligands.

The structure of complex (I) consists of a centrosymmetric dinuclear unit [Eu<sub>2</sub>(*L*)<sub>6</sub>(phen)<sub>2</sub>] and two free water molecules. The Eu<sup>III</sup> ion is nine-coordinated by two N-atom donors from one chelating phen ligand and seven O atoms from five distinct *L* ligands (Fig. 1). The Eu—O distances are in the range of 2.334 (2)–2.925 (2) Å, which are normal and in agreement with those found in other carboxylato-containing Eu<sup>III</sup> complexes (Zheng *et al.*, 2005; Wan *et al.*, 2002). The phen ligand acts as a typical chelating ligand coordinating to the Eu<sup>III</sup> ion with Eu—N bond distances of 2.591 (2) and 2.593 (2) Å, and an N—Eu—N angle of 63.57 (8)°. For *L*, there exists three different kinds of carboxylate coordination modes with the Eu<sup>III</sup> center, namely *syn-syn* bridging ( $\mu_2\text{-}\eta^1\text{:}\eta^1$ -bridging), symmetric bidentate chelate ( $\mu_1\text{-}\eta^1\text{:}\eta^1$ -chelating), and tridentate chelating/bridging ( $\mu_2\text{-}\eta^1\text{:}\eta^2$ -chelating/bridging). In this case two Eu<sup>III</sup> ions are connected to form an eight-membered ring [Eu1/O6/C23/O5/Eu1A/O6A/C23A/O5A], as well as a four-membered ring [Eu1/O4/Eu1A/O4A]. The non-bonding Eu1···Eu1A separation is 4.1594 (4) Å (symmetry operation A = 1 - *x*, 1 - *y*, 1 - *z*).

Adjacent dinuclear [Eu<sub>2</sub>(*L*)<sub>6</sub>(phen)<sub>2</sub>] units are linked into two different chains running along the [01 $\bar{1}$ ] (Fig. 2) and [1 $\bar{1}\bar{1}$ ] (Fig. 3) and thus generating a two-dimensional sheet parallel to the (011) by intermolecular O—H···O hydrogen-bonding interactions (Table 1) between different *L* ligands (Fig. 4). The sheets are cross-linked via O—H···O hydrogen bonds involving the water molecules. In addition, intermolecular  $\pi$ — $\pi$  stacking interactions are observed between the

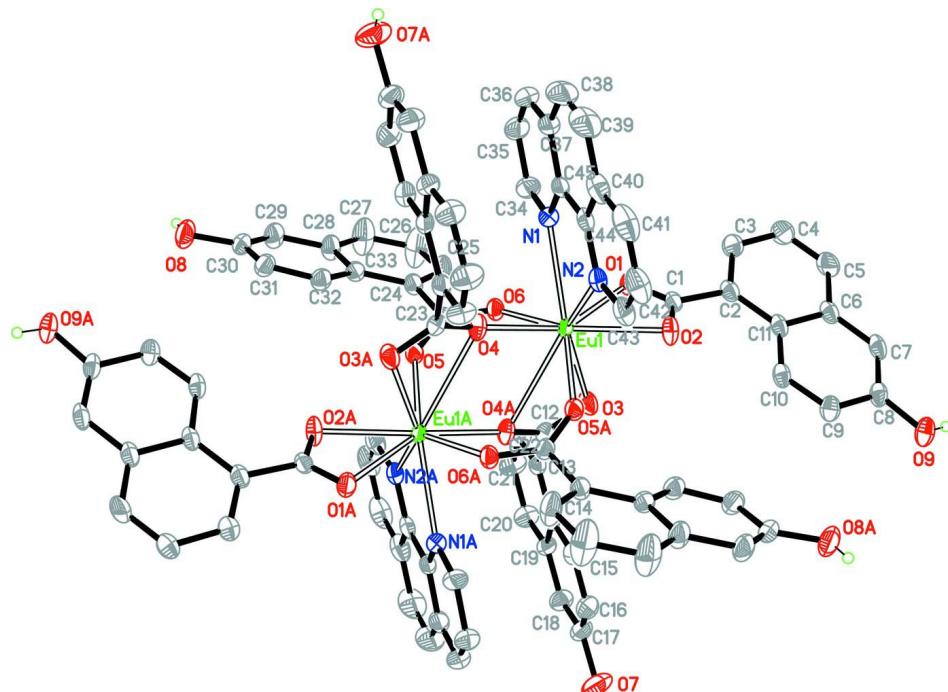

N2/C43/C42/C41/C40/C44 pyridine rings of the phen ligands at (x, y, z) and (1-x, -y, 1-z), with a centroid-to-centroid separation of 3.547 (2) Å.

## S2. Experimental

A mixed solution of 6-hydroxy-1-naphthoic acid (0.05 mmol) and 1,10-phenanthroline (0.05 mmol) in CH<sub>3</sub>OH (10 ml) in the presence of excess 2,6-dimethylpyridine (*ca* 0.05 ml for adjusting the pH value to basic condition) was carefully layered on top of a H<sub>2</sub>O solution (15 ml) of Eu(ClO<sub>4</sub>)<sub>3</sub> (0.1 mmol) in a test tube. Yellow single crystals suitable for X-ray analysis of the title complex (I) appeared at the tube wall after *ca* two weeks at room temperature. Yield: ~40% based on 6-hydroxy-1-naphthoic acid. Elemental analysis calculated for C<sub>45</sub>H<sub>31</sub>EuN<sub>2</sub>O<sub>10</sub>: C 59.28, H 3.43, N 3.07%; found: C 59.36, H 3.50, N 3.03%.

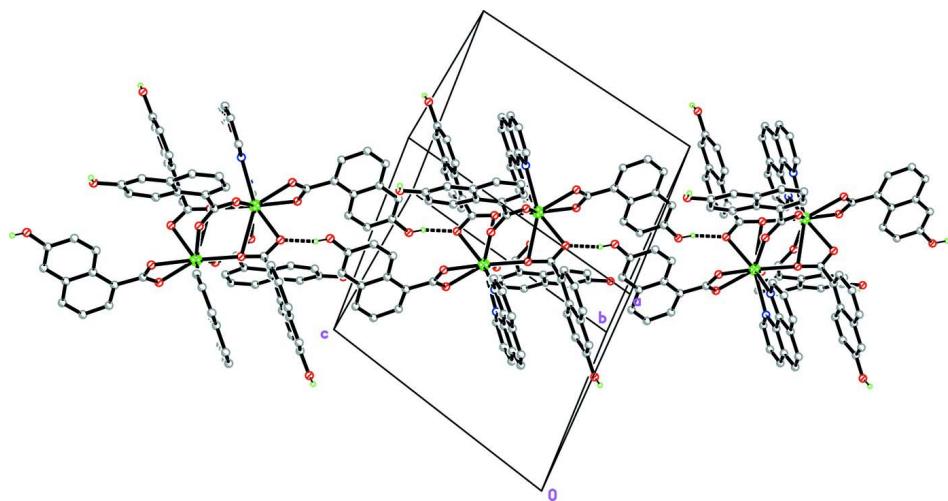

## S3. Refinement

The water H atoms were located in a difference Fourier map and treated as riding on their parent atoms, with O-H = 0.85 Å and U<sub>iso</sub>(H) = 1.2U<sub>eq</sub>(O). C-bound H-atoms were included in calculated positions and treated as riding atoms: C-H = 0.93 Å with U<sub>iso</sub>(H) = 1.2 U<sub>eq</sub>(C).

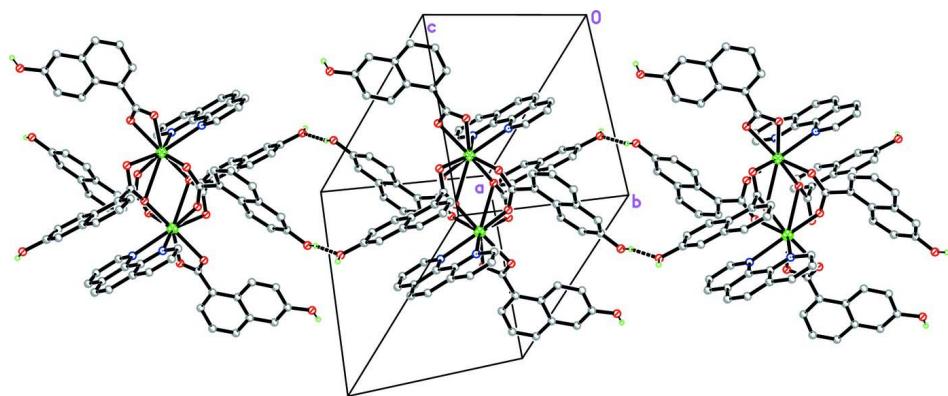

**Figure 1**

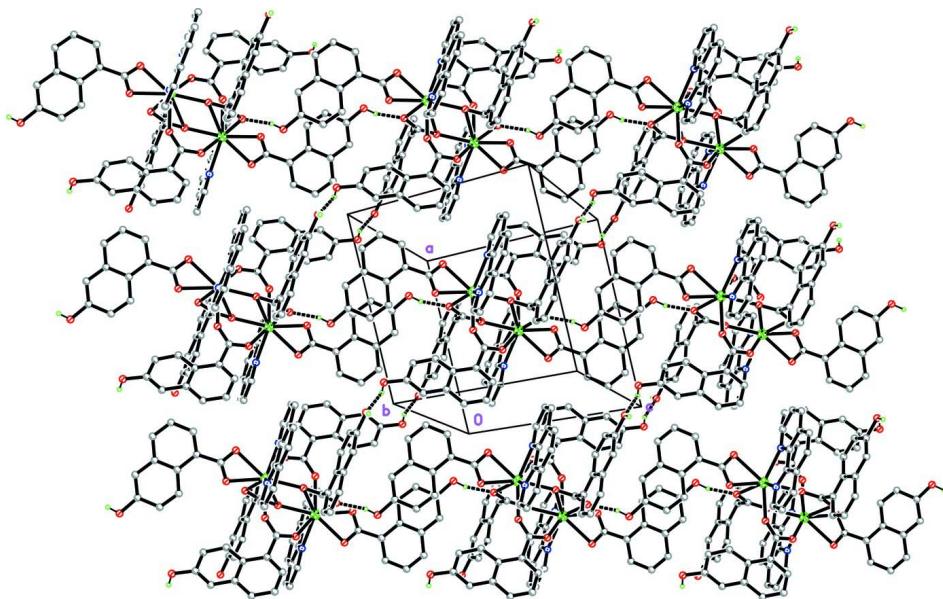

The molecular structure of the title complex. Displacement ellipsoids are drawn at the 30% probability level. Atom-labelled with the suffix A are generated by the symmetry operation (1 - x, 1 - y, 1 - z). Free water molecules have been omitted for clarity.

**Figure 2**

A view of a chain running along the  $[0\bar{1}\bar{1}]$ , formed by  $\text{O}—\text{H}··\cdot\text{O}$  hydrogen-bonding interactions. For clarity, only H atoms involved in the interactions are shown.

**Figure 3**

A view of a chain running along the  $[1\bar{1}\bar{1}]$ , formed by  $\text{O}—\text{H}··\cdot\text{O}$  hydrogen-bonding interactions. For clarity, only H atoms involved in the interactions are shown.

**Figure 4**

A view of the two-dimensional network of dinuclear complex, formed by O—H···O hydrogen-bonding interactions (solid dashed lines). For clarity, only H atoms involved in the interactions are shown.

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
