Received 5 December 2009; accepted 11 December 2009
Key indicators: single-crystal X-ray study; $T=110 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.058 ; w R$ factor $=0.164 ;$ data-to-parameter ratio $=14.9$.

In the title compound, $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{BrClO}$, the dihedral angle between mean planes of the bromo- and chloro-substituted benzene rings is $46.2(2)^{\circ}$ compared to $45.20(9)^{\circ}$ in the structure with the Cl substituent in the meta position of the aromatic ring. The dihedral angles between the mean plane of the prop-2-ene-1-one group and the mean planes of the 4bromophenyl and 3-chlorophenyl rings are 28.7 (5) and $24.2(4)^{\circ}$, respectively. In the crystal, weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions occur.

Jerry P. Jasinski, Ray J. Butcher, B. Narayana, K. Veena and H. S. Yathirajan

## S1. Comment

In continuation of our interest in the synthesis and crystal structure determination of chalcones, the title chalcone, $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{BrClO}$, is synthesized and its crystal structure is reported.

The title compound, (I), is a chalcone derivative with 4-bromophenyl and 3-chlorophenyl rings bonded at the opposite ends of a propenone group, the biologically active region (Fig.1). The dihedral angle between mean planes of the chloro and bromo substituted benzene rings is $46.2(2)^{\circ}$ compared to $45.20(9)^{\circ}\left(\mathrm{Ng}\right.$ et al. (2006)) and $46.70(5)^{\circ}$ for a similar related molecule. The angles between the mean plane of the prop-2-ene-1-one group and the mean planes of the 4-bromophenyl and 3-chlorophenyl rings are $28.7(5)^{\circ}$ and $24.2(4)^{\circ}$ and respectively. This compares to $20.66(1)^{\circ}$ and $24.54(1)^{\circ}$ in the similar structure. While no classical hydrogen bonds are present, weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \pi$-ring interactions are observed which contribute to the stability of crystal packing (Fig.2, Table 1).

## S2. Experimental

$50 \% \mathrm{KOH}$ was added to a mixture of 3-chloroacetophenone ( 0.01 mol ) and p-bromobenzaldehyde $(0.01 \mathrm{~mol})$ in 25 ml of ethanol (Scheme 2). The mixture was stirred for an hour at room temperature and the precipitate was collected by filtration and purified by recrystallization from ethanol. Single crystals were grown from ethyl acetate by slow evaporation method with the yield of the compound being $70 \%$ (m.p. $412-414 \mathrm{~K}$ ). Analytical data for $\mathrm{C}_{15} \mathrm{H}_{10} \mathrm{BrClO}$ :
Found (Calculated): C \%: 55.97 (56.02); H\%: 3.09 (3.13).

## S3. Refinement

All of the H atoms were placed in calculated positions and then refined using the riding model with $\mathrm{C}-\mathrm{H}=0.95 \AA$, and with $U_{\text {iso }}(\mathrm{H})=1.17-1.21 U_{\text {eq }}(\mathrm{C})$.

$\Delta \rho_{\text {max }}=1.78 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-1.29 \mathrm{e} \AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
