## $N, N^{\prime}-B i s($ phenylsulfonyl)maleamide. Corrigendum

B. Thimme Gowda, ${ }^{\text {a* }}$ Sabine Foro, ${ }^{\text {b }}$ P. A. Suchetan ${ }^{\text {a }}$ and Hartmut Fuess ${ }^{\text {b }}$

${ }^{\text {a }}$ Department of Chemistry, Mangalore University, Mangalagangotri 574 199, Mangalore, India, and ${ }^{\mathbf{b}}$ Institute of Materials Science, Darmstadt University of Technology, Petersenstrasse 23, D-64287 Darmstadt, Germany
Correspondence e-mail: gowdabt@yahoo.com
Received 1 March 2010; accepted 8 March 2010

The chemical name of the title compound in the paper by Gowda, Foro, Suchetan \& Fuess [Acta Cryst. (2010), E66, o187] is corrected.

In the paper by Gowda et al. (2010), the chemical name given in the Title should be for the trans rather than the cis isomer, i.e. the title should be ' $N, N$ '-Bis(phenylsulfonyl)fumaramide'.

## $N, N^{\prime}$-Bis(phenylsulfonyl)maleamide

B. Thimme Gowda, ${ }^{\text {a }}$ * Sabine Foro, ${ }^{\text {b }}$ P. A. Suchetan ${ }^{\text {a }}$ and Hartmut Fuess ${ }^{\text {b }}$

${ }^{\text {a }}$ Department of Chemistry, Mangalore University, Mangalagangotri 574 199, Mangalore, India, and ${ }^{\mathbf{b}}$ Institute of Materials Science, Darmstadt University of Technology, Petersenstrasse 23, D-64287 Darmstadt, Germany Correspondence e-mail: gowdabt@yahoo.com

Received 13 December 2009; accepted 14 December 2009

Key indicators: single-crystal X-ray study; $T=299 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.030 ; w R$ factor $=0.083$; data-to-parameter ratio $=14.2$.

Molecules of the title compound, $\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{~S}_{2}$, show crystallographic inversion symmetry: there is one half-molecule in the asymmetric unit. The structure exhibits both intramolecular and intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds.

## $N, N^{\prime}$-Bis(phenylsulfonyl)maleamide

B. Thimme Gowda, Sabine Foro, P. A. Suchetan and Hartmut Fuess

## S1. Comment

Diaryl acylsulfonamides are known as potent antitumor agents against a broad spectrum of human tumor xenografts in nude mice. As part of a study of the effect of ring and the side chain substituents on the solid state structures of $N$ aromatic sulfonamides (Gowda et al., 2009, 2010; Suchetan et al., 2009), in the present work, the structure of $\mathrm{N}, \mathrm{N}$-(Diphenylsulfonyl)maleamide (I) has been determined (Fig. 1).
The conformations of $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds in the amide fragments are trans to each other and the amide O atoms are anti to the H atoms attached to the adjacent C atoms, similar to that observed in $\mathrm{N}, \mathrm{N}$-(diphenylsulfonyl)succinamide (II) (Gowda et al., 2010). The molecule is bent at the S atoms with the $\mathrm{C}-\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(\mathrm{O})$ torsion angle of 66.1 (2) ${ }^{\circ}$ in (II), compared to the value of $65.2(2)^{\circ}$. The dihedral angle between the benzene ring and the $\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(\mathrm{O})-\mathrm{C}$ segment in the two halves of the molecule is $76.4(1)^{\circ}$, compared to the corresponding angle of 77.4 (1) ${ }^{\circ}$ in (II). The structure exhibits both the intramolecular and intermolecular hydrogen bonds. The series of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}(\mathrm{S})$ hydrogen bonds (Table 1) link the molecules into column like infinite chains parallel to $a$-axis (Fig. 2).

## S2. Experimental

$N, N$-(Diphenylsulfonyl)maleamide was prepared by refluxing a mixture of maleic anhydride ( 0.01 mol ), benzenesulfonamide $(0.02 \mathrm{~mol})$ and POCl 3 for 3 hr on a water bath. The reaction mixture was allowed to cool. Ether was added to it. The solid product obtained was filtered off, washed thoroughly with ether and hot alcohol and recrystallized to the constant melting point of $255-259^{\circ} \mathrm{C}$
Rod like single crystals used in the X-ray diffraction studies were obtained from a solution of the compound in DMF.

## S3. Refinement

The H atom of the NH group was located in difference map and later restrained to $\mathrm{N}-\mathrm{H}=0.86$ (1) $\AA$. The other H atoms were positioned with idealized geometry using a riding model with $\mathrm{C}-\mathrm{H}=0.93 \AA$. All H atoms were refined with isotropic displacement parameters set to 1.2 times of the $U_{\mathrm{eq}}$ of the parent atom.

Figure 1
Molecular structure of (I), showing the atom labelling scheme and displacement ellipsoids are drawn at the 50\% probability level.

Figure 2
Molecular packing of (I) with hydrogen bonding shown as dashed lines.

## Special details

Experimental. CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
