Received 5 December 2009; accepted 11 December 2009
Key indicators: single-crystal X-ray study; $T=110 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.036 ; w R$ factor $=0.099$; data-to-parameter ratio $=14.6$.

In the title compound, $\mathrm{C}_{15} \mathrm{H}_{11} \mathrm{ClO}$, the dihedral angle between the mean planes of the benzene ring and the chlorosubstituted benzene ring is $48.8(3)^{\circ}$. The dihedral angles between the mean plane of the prop-2-ene-1-one group and the mean planes of the 3-chlorophenyl and benzene rings are 27.0 (4) and $27.9(3)^{\circ}$, respectively. In the crystal, weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \pi$-ring interactions occur.

## (2E)-1-(3-Chlorophenyl)-3-phenylprop-2-en-1-one

Jerry P. Jasinski, Ray J. Butcher, B. Narayana, K. Veena and H. S. Yathirajan

## S1. Comment

Chalcones are known as the precursors of all flavonoid type natural products in biosynthesis (Marais et al., 2005). Chalcones exhibit various biological activities like insecticidal, antimicrobial, antichinoviral, antipicorniviral and bacteriostatic properties. Azachalcones, the derivatives of chalcones with an annular nitrogen atom in the phenyl ring, were reported to have a wide range of biological activities, such as antibacterial, antituberculostatic and antiinflammatory. An important feature of chalcones are their ability to act as activated unsaturated systems in conjugated addition of carbanions in presence of suitable basic catalysts. Many chalcones have been described for their high antimalarial activity, probably as a result of Michael addition of nucleophilic species to the double bond of the enone (Troeberg et al., 2000; Ram et al., 2000). Licochalcone A, isolated from Chinese liquorice roots, has been reported as being highly effective in chloroquine resistant Plasmodium falciparum strains in a $[3 \mathrm{H}]$ hypoxanthine uptake assay (Chen et al., 1994). Chalcones are also finding applications as organic non-linear optical materials (NLO) due to their good SHG conversion efficiencies (Sarojini et al., 2006). Recently, non-linear optical studies on a few chalcones and their derivatives were reported (Poornesh et al., 2009; Shettigar et al., 2006; 2008). In continuation with our studies of chalcones (Jasinski et al., 2007) and their derivatives and owing to the importance of these flavanoid analogs, the title chalcone, (I), was synthesized and its crystal structure reported herein.
The title compound, (I), is a chalcone with 3-chlorophenyl and benzene rings bonded at the opposite ends of a propenone group, the biologically active region (Fig.1). The dihedral angle between mean planes of the benzene and chloro substituted benzene rings is $48.8(3)^{\circ}$ as compared to 14.3 (7) ${ }^{\circ}$ in the 4 -chloro benzene analogue compound (Li \& $\mathrm{Su}, 1994)$. The angles between the mean plane of the prop-2-ene-1-one group and the mean planes of the 3 -chlorophenyl and benzene rings are 27.0 (4) ${ }^{\circ}$ and 27.9 (3) $)^{\circ}$, respectively, as compared to 19.4 (2) ${ }^{\circ}$ and 11.9 (9) ${ }^{\circ}$ in the aforementioned 4 -chloro benzene compound. While no classical hydrogen bonds are present, weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \pi$-ring interactions are observed which contribute to the stability of crystal packing (Table 1).

## S2. Experimental

$50 \% \mathrm{KOH}$ was added to a mixture of 3-chloro acetophenone ( 0.01 mol ) and benzaldehyde ( 0.01 mol ) in 25 ml of ethanol (Scheme 2). The mixture was stirred for an hour at room temperature and the precipitate was collected by filtration and purified by recrystallization from ethanol. The single-crystal was grown from ethyl acetate by slow evaporation method and yield of the compound was $72 \%$ (m.p.: $354-356 \mathrm{~K}$ ). Analytical data for $\mathrm{C}_{15} \mathrm{H}_{11} \mathrm{ClO}$ : Found (Calculated): C\%: 74.19 (74.23); H\%: 4.55 (4.57).

## S3. Refinement

All of the H atoms were placed in their calculated positions and then refined using the riding model with $\mathrm{C}-\mathrm{H}=0.95 \AA$, and with $U_{\mathrm{iso}}(\mathrm{H})=1.17-1.22 U_{\mathrm{eq}}(\mathrm{C})$.

## Figure 1

$h=-7 \rightarrow 5$
$k=-9 \rightarrow 9$
$l=-16 \rightarrow 15$

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0647 P)^{2}+0.2987 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.34$ e $\AA^{-3}$
$\Delta \rho_{\min }=-0.22 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.

Hydrogen-bond geometry ( $A,{ }^{\circ}$ )
Cg 1 is the centroid of the $\mathrm{C} 1-\mathrm{C} 6$ ring and Cg 2 is the centroid of the $\mathrm{C} 10-\mathrm{C} 15$ ring.
