Received 19 November 2009; accepted 9 January 2010

Key indicators: single-crystal X-ray study;  $T = 140$  K; mean  $\sigma(\text{C}-\text{C}) = 0.007$  Å;  
 $R$  factor = 0.035;  $wR$  factor = 0.079; data-to-parameter ratio = 14.3.

The environment at the Sn<sup>IV</sup> atom in the title compound, [Sn(C<sub>6</sub>H<sub>11</sub>)<sub>2</sub>(C<sub>18</sub>H<sub>11</sub>BrN<sub>2</sub>O<sub>3</sub>)], is distorted trigonal-bipyramidal, with the two cyclohexyl groups and the imino N atom forming the equatorial plane. The axial O—Sn—O angle is 155.97 (9)°. The presence of an intramolecular O—H···N hydrogen bond in the Schiff base ligand helps to stabilize the overall structure.

## [*N'*-(5-Bromo-2-oxidobenzylidene- $\kappa O$ )-3-hydroxy-2-naphthohydrazidato- $\kappa^2 N',O$ ]dicyclohexyltin(IV)

See Mun Lee, Hapipah Mohd Ali and Kong Mun Lo

### S1. Experimental

The Schiff base ligand was prepared by the condensation reaction of 3-hydroxy-2-naphthoyl hydrazide with 5-bromo-salicylaldehyde. The title compound was prepared from the equimolar reaction of the prepared Schiff base (0.74 g, 2.0 mmol) and dicyclohexyltin oxide (0.60 g, 2.0 mmol) in toluene. The solution was left for recrystallization for a week during which yellow crystals were obtained.

### S2. Refinement

Hydrogen atoms were placed at calculated positions (C–H 0.95 to 0.98 Å) and were treated as riding on their parent carbon atoms, with  $U(H)$  set to 1.2–1.5 times  $U_{eq}(C)$ . The hydroxy-H was refined with a restraint of  $0.84 \pm 0.01$  Å. There is a high peak near the tin atom.

where  $P = (F_o^2 + 2F_c^2)/3$  $(\Delta/\sigma)_{\max} = 0.001$  $\Delta\rho_{\max} = 1.60 \text{ e \AA}^{-3}$  $\Delta\rho_{\min} = -0.49 \text{ e \AA}^{-3}$ *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
