Received 30 March 2010; accepted 31 March 2010

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.025 ; w R$ factor $=0.102 ;$ data-to-parameter ratio $=19.6$.

In the title compound, $\left[\mathrm{ZnCl}_{2}\left(\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}\right)_{2}\right]$, the $\mathrm{Zn}^{\mathrm{II}}$ ion (site symmetry 2) adopts a near-regular tetrahedral $\mathrm{ZnN}_{2} \mathrm{Cl}_{2}$ coordination geometry. In the crystal, molecules are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds, generating (100) sheets containing $R_{2}^{2}(8)$ loops.

## Dianilinedichloridozinc(II)

Islam Ullah Khan, Ejaz, Onur Şahin and Orhan Büyükgüngör

## S1. Comment

The title compound is supramolecular complex of $\mathrm{Zn}^{\text {II }}$ having weak non-classical ( $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ ) hydrogen bonds, these nonclassical hydrogen bonds act as structural motif for construction of hydrogen bonded polymeric compounds. The intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bond interactions played important role to form a 2-dimensional framework. These hydrogen bonded zinc complexes have shown heterogeneous catalytic activities in some transesterification reaction (Park et al., 2008). The title compound is similar to our previously reported compound "Dianilinedibromidozinc(II)" Ejaz et al. (2009). Herein, we report the synthesis and crystal structure of the title compound, (I).

The molecular structure of (I) is presented in Fig.1. The compound crystallizes in the space group $\mathrm{C} 2 / \mathrm{c}$ with $\mathrm{Z}^{\prime}=1 / 2$. The $\mathrm{Zn}^{\text {II }}$ ion is located on a 2 -fold axis and is coordinated by two Cl atoms $\left[\mathrm{Zn} 1-\mathrm{Cl1} / \mathrm{Cl1}^{\mathrm{i}}=2.2454(5) \AA\right]$ and two amino N atoms from aniline ligands $\left[\mathrm{Zn} 1-\mathrm{N} 1 / \mathrm{N} 1^{\mathrm{i}}=2.0515\right.$ (16) $\AA$ ] [symmetry code: (i) $\left.1-\mathrm{x}, \mathrm{y}, 3 / 2-\mathrm{z}\right]$. The geometry around the $\mathrm{Zn}^{I I}$ ion is that of a tetrahedral. The benzene ring plane is approximately planar, with maximum deviation from the leastsquares plane being 0.005 (2) $\AA$ for atom C1.
The amino nitrogen N1 in the molecule at ( $\mathrm{x}, \mathrm{y}, \mathrm{z}$ ) acts as a hydrogen-bond donor (Table 2) to atom $\mathrm{Cl} 1^{\mathrm{i}}$ so forming a centrosymmetric $\mathrm{R}_{2}{ }^{2}(8)$ (Bernstein et al., 1995) ring centred at ( $1 / 2,0,1 / 2$ ). Similarly, amino nitrogen N 1 in the molecule at ( $\mathrm{x}, \mathrm{y}, \mathrm{z}$ ) acts as a hydrogen-bond donor to atom $\mathrm{Cl} 1^{\text {ii }}$ so forming a $\mathrm{C}(4)\left[\mathrm{R}_{2}{ }^{2}(8)\right]$ chain of rings running parallel to the [0-10] direction. The combination of $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds generates $\mathrm{R}_{4}{ }^{3}(12)$ rings parallel to the bc plane (Fig. 2).

## S2. Experimental

The title compound was synthesized from zinc chloride ( $0.136 \mathrm{~g}, 1 \mathrm{mmol}$ ) and aniline ( $0.186 \mathrm{ml}, 2 \mathrm{mmol}$ ) in methanol $(20 \mathrm{ml})$. Colourless prisms of (I) were obtained from methanol.

## S3. Refinement

All H atoms bound to C atoms were refined using a riding model, with $\mathrm{C}-\mathrm{H}=0.93 \AA$ and $\mathrm{U}_{\mathrm{iso}}(\mathrm{H})=1.2 \mathrm{U}_{\mathrm{eq}}(\mathrm{C})$ for aromatic C atoms. Amino H atoms were located in difference maps and refined subject to a DFIX restraint of $\mathrm{N}-\mathrm{H}=$ 0.86 (2) Å.

Figure 1
A view of the molecule of (I), showing displacement ellipsoids drawn at the $30 \%$ probability level. [Symmetry code: (i) $1-x, y, 3 / 2-z$.

Figure 2
Part of the crystal structure of (I), showing the formation of $\mathrm{R}_{2}{ }^{2}(8)$ and $\mathrm{R}_{4}{ }^{3}(12)$ rings. H atoms not involved in these interactions have been omitted for clarity. (Symmetry codes as in Table 2).

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor wR and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
