Received 2 April 2010; accepted 13 April 2010
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.034 ; w R$ factor $=0.097 ;$ data-to-parameter ratio $=16.4$.

The title compound, $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{O}_{4}$, a dihydrochalcone, was isolated from the rhizomes of Etlingera littoralis. The molecule is twisted with a dihedral angle of 71.69 (6) ${ }^{\circ}$ between the two aromatic rings. The propanone unit makes dihedral angles of 4.07 (6) and $73.56(7)^{\circ}$, respectively, with the 2,6-dihydroxy-4methoxyphenyl and phenyl rings. The methoxy group is approximately coplanar with the attached benzene ring with a dihedral angle of $1.74(10)^{\circ}$. An intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond generates an $S(6)$ ring motif. In the crystal, intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules into chains along [201]. A $\pi-\pi$ interaction with a centroidcentroid distance of 3.5185 (6) $\AA$ is also observed.

## 1-(2,6-Dihydroxy-4-methoxyphenyl)-3-phenylpropan-1-one

## Suchada Chantrapromma, Jutatip Jeerapong, Thongchai Kruahong, Surat Laphookhieo and Hoong-Kun Fun

## S1. Comment

Zingiberaceae plants are the ground plants of tropical forests. Many of them are used for food, spices, medicines, dyes, perfume and aesthetics (Sirirugsa, 1999). Secondary metabolites from Zingiberaceae plants have found to be antiinflammatory (Reanmongkol et al., 2006), HIV-1 protease inhibitory (Tewtrakul, Subhadhirasakul \& Kummee, 2003; Tewtrakul, Subhadhirasakul, Puripattanavong \& Panphadung, 2003). Etlingera littoralis is one of the Zingiberaceae plants and its decoction of the rhizomes has been used for the treatment of stomachache, carminative and heart tonic (Chuakul \& Boonpleng, 2003). As part of our study of chemical constituents and bioactive compounds from the rhizomes of Etlingera littoralis which were collected from Surat Thani province in the southern of Thailand, the title dihydrochalcone, (I), was isolated. Herein we report its crystal structure. The title compound was found to possess antibacterial (Nowakowska, 2007) and antiplasmodial activities (Portet et al., 2007).
The molecule of the title dihydrochalcone (Fig. 1), $\mathrm{C}_{16} \mathrm{H}_{16} \mathrm{O}_{4}$, is twisted as the dihedral angle between the 2,6-di-hydroxy-4-methoxyphenyl and phenyl rings is $71.69(6)^{\circ}$. Whereas the 1-propanone unit (C7-C9/O1) makes the dihedral angles of 4.07 (6) and $73.56(7)^{\circ}$ with the C1-C6 benzene and C10-C15 phenyl rings, respectively. The two hydroxy and a methoxy groups are co-planar with the attached benzene ring with the r.m.s. of 0.0078 (1) $\AA$ for the ten non H atoms and the torsion angle $\mathrm{C} 16-\mathrm{O} 3-\mathrm{C} 3-\mathrm{C} 2=-1.66(15)^{\circ}$. An intramolecular $\mathrm{O} 2-\mathrm{H} 1 \mathrm{O} 2 \cdots \mathrm{O} 1$ hydrogen bond generates an S(6) ring motif (Bernstein et al., 1995) (Fig. 1 and Table 1). The bond distances are of normal values (Allen et al., 1987) and are comparable with the closely related structure ( Ng et al., 2005).
In the crystal packing (Fig. 2), $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1) formed between the two hydroxy groups link the molecules into chains along the [201] direction in which the adjacent chains are in anti-parallel manner. A $\pi-\pi$ interaction with $C g 1 \cdots C g 1$ distance of 3.5185 (6) Å was observed (symmetry code $\mathrm{x},-\mathrm{y},-1 / 2+\mathrm{z}$ ); $C g 1$ is the centroid of the C1-C6 benzene ring.

## S2. Experimental

The fresh rhizomes of $E$. littoralis ( 3.89 kg ) were chopped and extracted with $50 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$, over the period of 3 days at room temperature. The extraction was filtered and evaporated to dryness under reduced pressure to give crude extract which was further partitioned with water and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to afford the dichloromethane extract $(22.88 \mathrm{~g})$. The portion of dichloromethane extract ( 11.80 g ) was subjected to quick column chromatography (QCC) on silica gel eluting with a gradient of EtOAc-hexane to give thirteen fractions. Fraction F8 ( 322.4 mg ) was washed with $20 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane yielding solid which was further separated by column chromatography on silica gel with $70 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane to give compound (I) ( 50.1 mg ). Yellow block-shaped single crystals of the compound (I) suitable for $X$-ray structure determination were obtained from ethyl acetate by slow evaporation at room temperature after a few days, Mp 443 K . The NMR spectral data were consistent with the $X$-ray structure.

## S3. Refinement

Hydroxy H atoms attached to O 4 was located from a difference map and isotropically refined. The remaining H atoms were placed in calculated positions, with $d(\mathrm{O}-\mathrm{H})=0.82 \AA$ and $d(\mathrm{C}-\mathrm{H})=0.93 \AA$ for aromatic, 0.97 for $\mathrm{CH}_{2}$ and $0.96 \AA$ for $\mathrm{CH}_{3}$ atoms. The $U_{\mathrm{iso}}(\mathrm{H})$ values were constrained to be $1.5 U_{\mathrm{eq}}$ of the carrier atom for hydroxy and methyl H atoms and $1.2 U_{\text {eq }}$ for the remaining H atoms. A rotating group model was used for the methyl groups. The highest residual electron densitypeak is located at $0.69 \AA$ from C1 and the deepest hole is located at $0.84 \AA$ from C7. A total of 2607 Friedel pairs were merged before final refinement as there is no large anomalous dispersion for the determination of the absolute configuration.

Figure 1
The molecular structure of the title compound, with $50 \%$ probability displacement ellipsoids and the atom-numbering scheme.

Figure 2
The crystal packing of the title compound viewed down the $b$ axis, showing chains running along the [201] direction. Hydrogen bonds are shown as dashed lines.

2 restraints
Primary atom site location: structure-invariant direct methods

## Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier \& Glazer, 1986) operating at 100.0 (1) K.
Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional R-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(F^{2}\right)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
