Received 23 March 2010; accepted 30 March 2010

Key indicators: single-crystal X-ray study;  $T = 223$  K; mean  $\sigma(\text{C}-\text{C}) = 0.006$  Å;  $R$  factor = 0.052;  $wR$  factor = 0.140; data-to-parameter ratio = 14.8.

The crystal structure of the title compound,  $[\text{Cu}(\text{C}_{26}\text{H}_{22}\text{P}_2)_2][\text{CuCl}_2]$ , is composed of discrete  $\text{Cu}(\text{dppey})_2^+$  cations [dppey is *cis*-bis(diphenylphosphino)ethene] and  $[\text{CuCl}_2]^-$  anions. The tetrahedral  $\text{Cu}(\text{P}-\text{P})_2$  core of the  $[\text{Cu}(\text{dppey})_2]^+$  cation is distorted, with  $\text{Cu}-\text{P}$  bond lengths ranging from 2.269 (1) to 2.366 (1) Å. The five-membered  $-\text{Cu}-\text{P}-\text{CH}=\text{CH}-\text{P}-$  rings adopt envelope conformations, with the Cu atom lying 0.38 and 0.65 Å out of the  $\text{P}-\text{C}=\text{C}-\text{P}$  planes. The  $\text{Cu}-\text{Cl}$  distances in the  $[\text{CuCl}_2]^-$  anion are 2.094 (2) and 2.096 (2) Å, with a  $\text{Cl}-\text{Cu}-\text{Cl}$  angle of  $176.81(7)^\circ$ .

**Bis[*cis*-bis(diphenylphosphino)ethene]copper(I) dichloridocuprate(I)****Peter C. Healy, John C. McMurtrie and Jocelyne Bouzaid****S1. Comment**

Previous single crystal structure determinations on the 1:2 adducts of copper(I) salts with the bidentate phosphine ligand, Ph<sub>2</sub>P(CH=CH)PPh<sub>2</sub> (dppey), show the formation of stable bis-chelated ionic complexes [Cu(dppey)<sub>2</sub>]X for X = PF<sub>6</sub> (Berners-Price *et al.*, 1992) and for BF<sub>4</sub> as an ethanol solvate (Healy *et al.*, 2009). In this present work, addition of aqueous hydrochloric acid to a suspension of copper(I) oxide in a solution of dppey in ethanol resulted in the dissolution of the red copper oxide and subsequent precipitation of crystals of the title complex, [Cu(dppey)<sub>2</sub>][CuCl<sub>2</sub>] (I), the structure of which is reported here.

The crystal structure consists of discrete [Cu(dppey)<sub>2</sub>]<sup>+</sup> cations and [CuCl<sub>2</sub>]<sup>-</sup> anions (Fig. 1). In the cation, the four Cu—P bond lengths are dispersed over the range 2.269 (1) - 2.366 (1) Å. The overall Cu(P—P)<sub>2</sub> coordination geometry about the copper atom is distorted tetrahedral with the intra-ligand 'bite' angles 89.61 (4) and 87.15 (4)° while the the P—Cu—P inter-ligand angles range from 115.54 (4) - 123.27 (4)°. Angular distortion of the Cu(L—L)<sub>2</sub> core of four-coordinate bis(bidentate) complexes can be conveniently described by the angular distortion parameters  $\theta_x$ ,  $\theta_y$  and  $\theta_z$ , where  $\theta_x$  and  $\theta_y$  represent rocking motions of the two CuP<sub>2</sub> planes with respect to each other and  $\theta_z$  the degree of twist between the two planes (Dobson *et al.*, 1984; Healy *et al.*, 2008). For complexes with D<sub>2d</sub> symmetry,  $\theta_x = \theta_y = \theta_z = 90^\circ$ . For this present cation, the values of  $\theta_x$ ,  $\theta_y$  and  $\theta_z$ , are 93.4, 86.9 and 92.8°. The five membered -Cu—P—CH=CH—P- rings adopt envelope conformations with the copper atom lying 0.38 Å out of the P1—C12=C23—P2 plane and 0.65 Å out of the P3—C33=C43—P4 plane.

These results show significant differences from those observed for both the PF<sub>6</sub> and BF<sub>4</sub> complexes, in which the Cu—P bond lengths span narrow ranges of 2.276 (2)-2.289 (2) Å and 2.272 (1)-2.282 (1) Å respectively. The parameters  $\theta_x$ ,  $\theta_y$  and  $\theta_z$  are 90.4, 90.4 and 108.6° for the PF<sub>6</sub> complex and 90.5, 89.7 and 72.7° for the BF<sub>4</sub> complex; while the distances of the copper from the ligand planes are 0.03, 0.21 Å and 0.04, 0.21 Å respectively.

The Cu—Cl distances in the anion are 2.094 (2) and 2.096 (2) Å. The anion deviates from linearity with the Cl—Cu—Cl angle 176.81 (7)°. These values are in accord with those reported for other compounds incorporating the [CuCl<sub>2</sub>]<sup>-</sup> anion (e.g. Rodenstein *et al.*, 2008; Wang *et al.*, 2005; Mirkhani *et al.*, 2004; Healy *et al.*, 1989; Asplund *et al.*, 1983). Four C—H...Cl contacts distances ranging between 2.9 and 3.0 Å are observed in the structure (C11...H314<sup>i</sup> 2.88 Å, C11...H323<sup>ii</sup> 2.99 Å, C12...H115<sup>iii</sup> 3.03 Å, C12...H33 3.00 Å; symmetry codes: (i) 1-x, -y, 2-z, (ii) x-1/2, 1/2-y, 1/2+z, (iii) x-1/2, 1/2-y, z-1/2).

Both the symmetric and anti-symmetric Cu—Cl stretching modes would be expected to be Raman active in this non linear (C<sub>2v</sub>) anion and in the solid state Raman spectrum of this complex we have assigned two bands of equal intensity observed at 304 and 319 cm<sup>-1</sup> not present in the spectrum of the free ligand to the  $\nu$ (Cu—Cl) stretching modes (cf. Bowmaker *et al.*, 1973; 2007).

## S2. Experimental

A concentrated aqueous solution of HCl was added dropwise to a suspension of Cu<sub>2</sub>O (0.067 g, 0.47 mmol) in a stirred solution of dppey (0.309 g, 0.78 mmol) in 10 ml ethanol until all the Cu<sub>2</sub>O dissolved and a white precipitate formed. The volume of the reaction mixture was increased to 30 ml and heated to reflux to give a clear solution. This was allowed to slowly cool to room temperature to give colourless crystals of the title complex suitable for single crystal X-ray diffraction studies. M.p. 490-491 K. Raman spectra on for the complex and ligand were recorded on a Renishaw InVia spectrometer.

## S3. Refinement

H atoms attached to carbons were constrained as riding atoms, with C–H set to 0.95 Å.  $U_{\text{iso}}(\text{H})$  values were set to  $1.2U_{\text{eq}}$  of the parent atom. Maximum residual electron density in the complex was located at 0.9 Å from the cationic copper site.

**Figure 1**

View of the cation and anion of the title complex. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level. H atoms are omitted for clarity.

 $\Delta\rho_{\min} = -1.04 \text{ e \AA}^{-3}$

*Special details*

**Geometry.** Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement on  $F^2$  for ALL reflections except those flagged by the user for potential systematic errors. Weighted  $R$ -factors  $wR$  and all goodnesses of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The observed criterion of  $F^2 > \sigma(F^2)$  is used only for calculating  $-R$ -factor-obs etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
