## Rietveld refinement of whitlockiterelated $\mathrm{K}_{0.8} \mathrm{Ca}_{9.8} \mathrm{Fe}_{0.2}\left(\mathrm{PO}_{4}\right)_{7}$

Igor V. Zatovsky,* Ivan V. Ogorodnyk, Nataliya Yu. Strutynska, Nikolay S. Slobodyanik and Nataliya O. Sharkina<br>Department of Inorganic Chemistry, Taras Shevchenko National University, 64 Volodymyrska str., 01601 Kyiv, Ukraine<br>Correspondence e-mail: zvigo@yandex.ru

Received 7 April 2010; accepted 19 April 2010

Key indicators: powder X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{P}-\mathrm{O})=0.024 \AA$; disorder in main residue; $R$ factor $=8.711 ; w R$ factor $=11.243$; data-to-parameter ratio $=5.4$.

The title compound, $\mathrm{K}_{0.8} \mathrm{Ca}_{9.8} \mathrm{Fe}_{0.2}\left(\mathrm{PO}_{4}\right)_{7}$ (potassium decacalcium iron heptaphosphate), belongs to the whitlockite family. The structure is built up from several types of metaloxygen polyhedra: two $\left[\mathrm{CaO}_{8}\right]$, one $\left[\mathrm{CaO}_{7}\right]$ and one $[(\mathrm{Ca} /$ $\mathrm{Fe}) \mathrm{O}_{6}$ ] polyhedron with a mixed $\mathrm{Ca} / \mathrm{Fe}$ occupancy in a $0.8: 0.2$ ratio, as well as three tetrahedral $\left[\mathrm{PO}_{4}\right]$ units. Of the 18 sites in the asymmetric unit, the site with the mixed $\mathrm{Ca} / \mathrm{Fe}$ occupation, the K site, one P and one O site are on special positions $6 a$ with 3 symmetry, whereas all other sites are on general positions $18 b$. The linkage of metal-oxygen polyhedra and $\left[\mathrm{PO}_{4}\right]$ tetrahedra via edges and corners results in formation of a three-dimensional framework with composition $\left[\mathrm{Ca}_{9.8} \mathrm{Fe}_{0.2}\left(\mathrm{PO}_{4}\right)_{7}\right]^{0.8-}$. The remaining K atoms (site-occupation factor $=0.8$ ) are located in large closed cavities and are nine-coordinated by oxygen.

# Rietveld refinement of whitlockite-related $\mathrm{K}_{0.8} \mathrm{Ca}_{9.8} \mathrm{Fe}_{0.2}\left(\mathrm{PO}_{4}\right)_{7}$ 

Igor V. Zatovsky, Ivan V. Ogorodnyk, Nataliya Yu. Strutynska, Nikolay S. Slobodyanik and Nataliya O. Sharkina

## S1. Comment

In the compound $\mathrm{K}_{0.8} \mathrm{Ca}_{9.8} \mathrm{Fe}_{0.2}\left(\mathrm{PO}_{4}\right)_{7}$, (I), atoms $\mathrm{Ca} 4 / \mathrm{Fe} 4, \mathrm{~K} 1, \mathrm{P} 1$ and O 11 are in special positions $6 a$ that lie on a 3-fold rotation axis, whereas all other atoms are located in general positions $18 b$ (Fig. 1).
Compound (I) might be represented as a result of an aliovalent substitution of calcium atoms in $\beta-\mathrm{Ca}_{3}\left(\mathrm{PO}_{4}\right)_{2}$ (Calvo et al., 1975; Yashima et al., 2003) by a pair of K and Fe atoms.
$\left[\mathrm{CaO}_{x}\right]$ polyhedra (two types of $\left[\mathrm{CaO}_{8}\right]$, one of $\left[\mathrm{CaO}_{7}\right]$ and one $\left[(\mathrm{Ca} / \mathrm{Fe}) \mathrm{O}_{6}\right]$ with mixed $\mathrm{Fe} / \mathrm{Ca}$ occupancy) and three different $\left[\mathrm{PO}_{4}\right]$ tetrahedra are linked via edges and corners to built a three-dimensional framework with composition $\left[\mathrm{Ca}_{9.8} \mathrm{Fe}_{0.2}\left(\mathrm{PO}_{4}\right)_{7}\right]^{0.8-}$ (Fig. 2). The $\mathrm{K}^{+}$cations are located in large closed cavities inside the framework ( K 1 occupancy is equal to 0.8 ).
For (I), $\mathrm{Ca}-\mathrm{O}$ distances of $\left[\mathrm{CaO}_{8}\right]$ - and $\left[\mathrm{CaO}_{7}\right]$-polyhedra (2.295 (15)-2.78 (3) $\AA$ ) are close to these in previously reported isotypic compounds $s-\mathrm{Ca}_{9} \mathrm{Fe}\left(\mathrm{PO}_{4}\right)_{7}\left(2.29(3)-2.73(3) \AA\right.$ ), $o-\mathrm{Ca} 9 \mathrm{Fe}^{2}\left(\mathrm{PO}_{4}\right)_{7}(2.29$ (3)-2.70 (4) $\AA$ ) (Lazoryak et al., 1996) and $\mathrm{KCa}_{10}\left(\mathrm{PO}_{4}\right)_{7}(2.329$ (3)-2.76 (2) $\AA$ ) (Sandström \& Boström, 2006). The distances $\mathrm{Ca} / \mathrm{Fe}-\mathrm{O}$ (2.23 (4)-2.29 (3) $\AA$ ) within the $\left[(\mathrm{Ca} / \mathrm{Fe}) \mathrm{O}_{6}\right]$ polyhedron are close to these of the $\left[\mathrm{CaO}_{6}\right]$ polyhedron in $\mathrm{KCa}_{10}\left(\mathrm{PO}_{4}\right)_{7}(2.239(4)-2.267$ (4) $\AA)$, while they significantly differ from $d(\mathrm{Fe}-\mathrm{O})=1.95(3)-2.17(3) \AA$ in $\mathrm{Ca}{ }_{9} \mathrm{Fe}^{\left(\mathrm{PO}_{4}\right)_{7}}$.
Potassium atoms are nine-coordinated (three triples of $\mathrm{K} — \mathrm{O}$ distances in the range of 2.508 (19)-3.24 (3) $\AA$ ) (Fig. 3), while in $\mathrm{KCa}_{10}\left(\mathrm{PO}_{4}\right)_{7}$ the $\mathrm{K}-\mathrm{O}$ contacts vary in the range of 2.641 (3)-3.25 (4) $\AA$.
In conclusion, compound (I) can be considered as a solid solution within the $\mathrm{KCa}_{10}\left(\mathrm{PO}_{4}\right)_{7} / \mathrm{Ca} 9 \mathrm{Fe}^{( }\left(\mathrm{PO}_{4}\right)_{7}$ double system.

## S2. Experimental

The title compound was prepared by solid state reaction from a mixture of $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{CaCO}_{3}, \mathrm{Fe}_{2} \mathrm{O}_{3}$ and $\mathrm{NH}_{4} \mathrm{H}_{2} \mathrm{PO}_{4}$ in the molar ratio $\mathrm{K} / \mathrm{Ca} / \mathrm{Fe} / \mathrm{P}=0.8: 9.8: 0.2: 7.0$. The reagents were finely ground in an agate mortar and then placed in a porcelain crucible. The thermal treatment was carried out in three steps. The first included preheating to 873 K to decompose the ammonium salt and carbonates. After that, the mixture was heated at 1273 K for 12 h , cooled to room temperature, reground, and held at 1373 K for 6 h . The resulting product was a pale pink powder.

## S3. Refinement

The powder pattern was indexed in rhombohedral cell (hexagonal setting) by Dicvol 2004 (Boultif \& Louër, 2004). The structure of $\mathrm{KCa}_{10}\left(\mathrm{PO}_{4}\right)_{7}$ (Sandström \& Boström, 2006) was selected as a starting model for Rietveld refinement. Profile matching refinement was performed firstly. Then scaling factor and background were added to the refined parameters. The background was approximated using linear interpolation between a set of background points with refineable heights. A modified pseudo-Voigt function (Thompson et al., 1987) was used for the profile refinement. As it was determined previously, only one position of calcium is suitable for heterovalent substitution by a three-valent $3 d$-metal. It is the
octahedrally coordinated Ca 4 site. Thus the iron site was placed into the Ca 4 position. The occupancy of iron was fixed at 0.2 while the remaining calcium occupancy was set to 0.8 . The potassium occupancy was set to 0.8 due to electroneutrality of the compound. The atomic coordinates and $\mathrm{B}_{\text {iso }}$ of Ca and Fe were constrained to be equal. ADPs of all P atoms were constrained to be equal as well as the ADPs of all O atoms. The value of $\mathrm{B}_{\text {iso }}$ for Ca 4 was restrained in the range of $0.17-0.3$. The value of $\mathrm{B}_{\text {iso }}$ for O 11 was also restrained in the range of $0.2-0.3$. Two distance restraints for P 2 - O21 and P2-O23 bonds were applied. Experimental, calculated and difference patterns after the final refinement cycle are shown in Fig. 4.

## Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles
