Received 6 February 2010; accepted 20 May 2010

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.040 ; w R$ factor $=0.102 ;$ data-to-parameter ratio $=15.6$.

The molecule of the title compound, $\mathrm{C}_{18} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{4}$, is situated on a crystallographic centre of symmetry. The molecule has a zigzag structure, with two parallel symmetry-related indoline-2,3-dione fragments linked by an ethylene group at each N atom. In the crystal, the molecules stack in columns along the $b$ axis. There are two such columns in the structure. The molecules within each column are parallel; however, the molecules in the two columns differ in the respective orientation of the indoline-2,3-dione fragments. In one column, they are approximately parallel to (112), while in the other they are approximately parallel to ( $\overline{1} 12$ ). The interplanar angle between the indoline-2,3-dione fragments in the two columns is $80.83(3)^{\circ}$. The molecules within each column are related by mutual displacement of their centres of symmetry, that is $(0, \pm 1 / 2, \pm 1 / 2)$. The packing between the molecules is provided by weak interactions only, viz. $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds and $\pi-\pi$ [centroid-centroid distance $=$ 3.8745 (8) $\AA$ ] and $\mathrm{C}=\mathrm{O} \cdots \pi$ interactions.

## 1,1'-(Ethane-1,2-diyl)bis(indoline-2,3-dione)

## Yao Wang, Sheng-Li Cao, Chong-Qing Wan and Jing-Li Yuan

## S1. Comment

Isatins present a wide range of important biological and pharmacological activities. Fungicide (Breinholt et al., 1996), antianxiety (Norman, 1996; Breinholt et al., 1996) and anticonvulsant ones (Rajopadhye \& Popp, 1988) are among them. In particular, the title compound, 1,2-bis[(indolin-2,3-dion)-1-yl]ethane, and related 1,1-bis \{4-[(2,3-dioxoindolin-1yl)methyl]phenyl\}methane and 1-(3,4-dichlorobenzyl)indoline-2,3-dione (Hyatt et al., 2007) have been considered as potent and selective carboxylesterase inhibitors (Hyatt et al., 2007). Herein, we report the structure of the title compound.
The centrosymmetric molecule takes a zigzag fashion, with two symmetric parallel indoline-2,3-dione fragments being linked by the ethylene group to the N atoms (Fig. 1). There are only weak intermolecular interactions in the structure: a $\pi$ -electron- $\pi$-electron ring interaction between $\mathrm{N} 1 \backslash \mathrm{C} 1 \backslash \mathrm{C} 6 \backslash \mathrm{C} 7 \backslash \mathrm{C} 8$ (pyrrole) and $\mathrm{C} 1 \backslash \mathrm{C} 2 \backslash \mathrm{C} 3 \backslash \mathrm{C} 4 \backslash \mathrm{C} 5 \backslash \mathrm{C} 6$ (benzene) rings (symmetry code: $x, y+1, z$ ) with the distance between the respective centroids equal to 3.8745 (8) $\AA$. A C-H $\cdots \mathrm{O}$ bond is given in Tab. 1 while $\mathrm{C}=\mathrm{O} \cdots \pi$-electron ring interactions are listed in Tab. 2.
The distance C7-C8 (1.5554 (19) Å) corresponds well to the pertinent distances previously observed in well determined structures with the indoline-2,3-dione fragment. The search in the Cambridge Structural Database (Allen, 2002; Cambridge Structural Database, version 5.31 and addenda up to 26 February 2010) yielded 12 hits with structures determined with $\mathrm{R}_{\text {val }}<0.05$. The corresponding extremal distances from this search equalled to 1.531 and $1.578 \AA$ for JOBDEG and NAQRAY, respectively.

## S2. Experimental

A mixture of indoline-2,3-dione ( $1.47 \mathrm{~g}, 10 \mathrm{mmol}$ ), 1,2-dibromoethane ( $5.64 \mathrm{~g}, 30 \mathrm{mmol}$ ) and $\mathrm{K}_{2} \mathrm{CO}_{3}(2 \mathrm{~g}, 14.5 \mathrm{mmol})$ in $N, N$-dimethylformamide ( 20 ml ) was heated at $100-120^{\circ} \mathrm{C}$ for 3 h . After cooling to room temperature, the reaction mixture was poured into $0^{\circ} \mathrm{C}$ water $(100 \mathrm{ml})$. The resulting precipitate was separated by filtration, dried in air and then it was purified by column chromatography on a silica gel with dichloromethane/methanol $=95: 5, \mathrm{v} / \mathrm{v}$, as an eluent. The precipitate included the prevailing product 1-(2-bromoethyl)indoline-2,3-dione ( $R_{\mathrm{f}}=0.77$, m.p. $131-132^{\circ} \mathrm{C}$; yield $60.9 \%$ ) as well as the the title product 1,2-bis[(indolin-2,3-dion)-1-yl]ethane ( $R_{\mathrm{f}}=0.64$, m.p. 296-297 ${ }^{\circ} \mathrm{C}$; yield $13.1 \%$ ). The prevailing product, 1-(2-bromoethyl)indoline-2,3-dione, has been determined by a mass spectrometric analysis while its melting point $\left(131-132^{\circ} \mathrm{C}\right)$ corresponded to $131^{\circ} \mathrm{C}$ reported by Schmidt et al. (2008). The orange crystals of the title compound that measured $0.40 \times 0.30 \times 0.20 \mathrm{~mm}$ on average were obtained by slow evaporation from the solution of dichloromethane $N, N$-dimethylformamide 50:50 (v/v).

## S3. Refinement

All the H atoms were discernible in the difference electron density maps. Nevertheless, the hydrogen atoms were placed into the idealized positions and allowed to ride on the carrier atoms, with $\mathrm{C}-\mathrm{H}=0.93$ and $0.97 \AA$ for aryl and methylene hydrogens, respectively. $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})_{\text {ary }} /$ methylene .

Figure 1
The title molecule with the atomic numbering scheme. The displacement ellipsoids are shown at the $50 \%$ probability level. Symmetry code: (i): $-x,-y,-z+1$.

Figure 2
The column motifs of the molecules of the title compound. The $\pi$-electron ring $\cdots \pi$-electron ring interactions are shown as a red dashed lines. $\mathrm{Cg} 1, \mathrm{Cg} 2$ are the centroids of the $\mathrm{N} 1-\mathrm{C} 1-\mathrm{C} 6-\mathrm{C} 7-\mathrm{C} 8$ (pyrrole) and $\mathrm{C} 1-\mathrm{C} 2-\mathrm{C} 3-\mathrm{C} 4-\mathrm{C} 5-\mathrm{C} 6$ (benzene) rings, respectively. Symmetry codes: (i): $x, 1+y, z$; (ii): $-x, 1 / 2+y, 3 / 2-z$.

Extinction coefficient: 0.060 (5)
```

## Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor wR and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
