## catena-Poly[[dibromidozinc(II)]- $\mu$-4-(3-pyridyl)-4H-1,2,4-triazole]

## Bin Ding* and Hong-Ai Zou

Tianjin Key Laboratory of Structure and Performance for Functional Molecules, Tianjin Normal University, Tianjin 300071, People's Republic of China Correspondence e-mail: qsdingbin@yahoo.com.cn

Received 8 June 2010; accepted 2 July 2010

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.010 \AA$; $R$ factor $=0.039 ; w R$ factor $=0.090 ;$ data-to-parameter ratio $=14.9$.

The title complex, $\left[\mathrm{ZnBr}_{2}\left(\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{~N}_{4}\right)\right]_{n}$, was formed under hydrothermal conditions using the ligand 4 -(3-pyridyl)- 4 H -1,2,4-triazole $(L)$. The unique $\mathrm{Zn}^{\mathrm{II}}$ ion is coordinated by one triazole N atom, one pyridine N atom and two Br atoms in a slightly distorted tetrahedral coordination environment. Symmetry-related $\mathrm{Zn}^{\mathrm{II}}$ ions are connected by bridging $L$ ligands into chains parallel to [001] in which the $\mathrm{Zn} \cdots \mathrm{Zn}$ separation is 8.643 (7) $\AA$. In the crystal structure, weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bonds link the chains into a three-dimensional network.

## S1. Comment

Supramolecular polymer chemistry is a branch of modern science which is developing rapidly through the combination of polymer chemistry with supramolecular chemistry (Lehn, 1995; Ouahab, 1997). Recently, considerable efforts have been devoted to crystal engineering of supramolecular architecture sustained by coordination covalent bonding, hydrogen bonding or some molecular interaction and their combination. The compounds formed are of interest owing to their fascinating structural diversity and potential application in design of porous materials with novel inclusion or reactivity properties and in supramolecular devices such as sensors and indicators (Moulton \& Zaworotko, 2001; Pan et al., 2001; Prior \& Rosseinsky, 2001; Ma et al., 2001; Ding et al., 2006). We report herein the crystal structure of the title complex.
A view of the coordination around the $\mathrm{Zn}^{\mathrm{II}}$ ion of the title compound is shown in Fig. 1. The unique $\mathrm{Zn}^{\mathrm{II}}$ ion is coordinated by one triazole nitrogen atom, one pyridine nitrogen atom and two bromine ligands in a slightly distorted tetrahedral coordination environment. Symmetry related $\mathrm{Zn}^{\text {II }}$ ions are connected by bridging $L$ ligands to form onedimensional chains (Fig. 2) in which the $\mathrm{Zn} \cdots \mathrm{Zn}$ separation is 8.643 (7) $\AA$. In the crystal structure, weak intermolecular C $-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bonds (Table 1) exist between $L$ triazole rings and bromine atoms pairs of inversion related 1-D chains, which are further assembled through $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ interactions to form a 3-D network (see Fig. 3).

## S2. Experimental

The ligand $L$ was prepared according to the previously reported literature methods (Gioia, et al., 1988). A mixture of $\mathrm{ZnBr}_{2}(22.5 \mathrm{mg}, 0.1 \mathrm{mmol}), L(14.6 \mathrm{mg}, 0.1 \mathrm{mmol})$ and water $(10 \mathrm{ml})$ was stirred for 5 h and filtered. The filtrate was kept in a $\mathrm{CaCl}_{2}$ desiccator. Suitable single crystals for X-ray diffraction study were obtained after a few days, yield $23 \%$ (based on $\mathrm{Zn}(\mathrm{II})$ salts). Anal. Calc. for $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{Br}_{2} \mathrm{~N}_{4} \mathrm{Zn}$ : C, $22.64 \%$; H, $1.63 \%$; N, $15.09 \%$. Found: C, $22.75 \%$; H, 1.87\%; N, 15.14\%. FT-IR (KBr): 3115 (w), 3050 (w), 2940(w), 1540(s), 1473(m), 1395(m), 1368(w), 1244(w), 1199(s), 1075(s), 1030(s), 978(w), 945(w), 869(s), 684(w), $640(s), 489(m), 425(\mathrm{w}) \mathrm{cm}_{-1}$.

## S3. Refinement

H atoms were positioned geometrically and were allowed to ride on their parent C atoms with $\mathrm{C}-\mathrm{H}=0.93 \AA$ and $U_{\mathrm{iso}}(\mathrm{H})$ $=1.2 U_{\mathrm{eq}}(\mathrm{C})$.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
