Received 5 July 2010; accepted 10 July 2010

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.023 ; w R$ factor $=0.056$; data-to-parameter ratio $=10.5$.

In the title polymeric complex, $\left[\mathrm{Cd}\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{6}\right)\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{0.5}\left(\mathrm{H}_{2} \mathrm{O}\right)\right]_{n}$, the $\mathrm{Cd}^{\mathrm{II}}$ ion is coordinated by four O atoms and three N atoms from two 5-(pyrazin-2-yl)tetrazolate ligands, two oxalate ligands and one water molecule, displaying a distorted monocapped octahedral geometry. The bridging ligands link metal centres, forming a three-dimensional network which is stabilized by intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen-bonding interactions.

## S1. Comment

In recent years, research on coordination polymers has made considerable progress in the fields of supramolecular chemistry and crystal engineering, because of their intriguing structural motifs and functional properties, such as molecular adsorption, magnetism, and luminescence. The reports on tetrazoles are expanding rapidly, since tetrazoles have an important role in coordination chemistry as ligands (Deng et al. 2007; Zeng et al. 2007). In the general reaction, tetrazoles are prepared by the addition of an azide to nitriles in water with the aid of a Lewis acid such a $\mathrm{Zn}^{2+}$. In this paper is reported the crystal structure of the title coordination polymer, which has been obtained under hydrothermal condition using 2-cyanopyrazine, $\mathrm{NaN}_{3}$, oxalic acid and the Lewis acid $\mathrm{CdCl}_{2}$ as reagents.
In the structure of the title compound (Fig. 1), each cadmium(II) centre is seven-coordinated by four O atoms and three N atoms from two 5-(2-pyrazinyl)tetrazolate ligands, two oxalate ligands and one water molecule, and can described as having a distorted monocapped octahedral geometry with $\mathrm{Cd} \cdots \mathrm{O}$ and $\mathrm{Cd} \cdots \mathrm{N}$ distances ranging from 2.312 (2) to 2.404 (2) $\AA \AA$ and from 2.284 (3) to 2.700 (3) Å, respectively. The 5-(2-pyrazinyl)tetrazolate and oxalate ligands act as bridging ligands, linking the metal centres to assemble a three-dimensional motif (Fig. 2). Within the three-dimensional network, centrosymmetrically related water molecules interact with adjacent tetrazolate ligands through $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds to form ten-membered rings with $R_{4}{ }^{4}(10)$ motifs (Bernstein et al., 1995).

## S2. Experimental

A mixture of $\mathrm{CdCl}_{2}(0.183 \mathrm{~g} ; 1 \mathrm{mmol})$, 2-cyanopyrazine ( $0.105 \mathrm{~g} ; 1 \mathrm{mmol}$ ), oxalic acid ( $0.09 \mathrm{~g} ; 1 \mathrm{mmol}$ ) and $\mathrm{NaN}_{3}$ $(0.065,1 \mathrm{mmol})$ in water $(10 \mathrm{ml})$ was stirred vigorously for 30 min and then sealed in a Teflon-lined stainless-steel autoclave ( 20 ml capacity). The autoclave was heated and maintained at 422 K for 50 h , and then cooled to room temperature at $5 \mathrm{~K} \mathrm{~h}^{-1}$. Colourless block crystals suitable for X-ray analysis were obtained.

## S3. Refinement

Water H atoms were located in a difference Fourier map and were refined with distance restraints of $\mathrm{O}-\mathrm{H}=0.82 \AA$ and $\mathrm{H} \cdots \mathrm{H}=1.35 \AA$, and with $U_{\mathrm{iso}}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{O})$. Other H atoms were placed in calculated positions $(\mathrm{C}-\mathrm{H}=0.93 \AA)$ and refined using a riding model, with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$

Figure 1
The molecular structure of the title complound showing the atomic-numbering scheme and displacement ellipsoids drawn at the $50 \%$ probability level. Symmetry codes: (i) $1-x, 1-y, 2-z$; (ii) $-1+x, y, z$; (iii) $-0.5-x,-1 / 2+y, 1.5-z$.

Figure 2
A view of the three-dimensional network of the title compound. Hydrogen bonds are shown as dashed lines.

\(w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0221 P)^{2}+1.3797 P\right]\)
where \(P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3\)
\((\Delta / \sigma)_{\text {max }}=0.001\)
\(\Delta \rho_{\text {max }}=0.33\) e \(\AA^{-3}\)
\(\Delta \rho_{\text {min }}=-0.77 \mathrm{e}^{-3}\)
```

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
