Received 20 August 2010; accepted 22 September 2010

Key indicators: single-crystal X-ray study; $T=120 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.022 ; w R$ factor $=0.068$; data-to-parameter ratio $=12.3$.

Molecules of the the title compound, $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{O}_{2}$, are located on a twofold rotation axis, which passes through the C atom linking the two N atoms. Two intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds were observed. In the crystal, non-classical intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules into chains along the $a$ axis. The crystal studied was a racemic twin.

## S1. Comment

It is interesting to notice that two types of non-classical intermolecular hydrogen bonds of $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ were found according to crystallographic data. The molecular structure and atom-numbering scheme for (I) are shown in Fig. 1. Its X-ray structure confirms the presence of intramolecular hydrogen bonds between the phenolic hydroxyl groups and nitrogen atoms $[\mathrm{N}-\mathrm{H}, 1.83$ (2) $\AA$ ), whereas the $\mathrm{N} \cdots \mathrm{O}$ distances $[2.652$ (2) $\AA$,] is significantly shorter than the corresponding $\mathrm{N} \cdots \mathrm{O}$ bond in related structures [2.70 (1) $\AA$ ]. Furthermore the observed $\mathrm{C}-\mathrm{O}$ bond length $[1.354$ (2) $\AA]$ is considerably shortened in relation to related structures [1.364 (2) $\AA$ ] (Rivera et al., 2010) and [1.365 (2) $\AA$ ] (Rivera et al., 2009). This additional H -bonding does not influence the $\mathrm{H}-\mathrm{O}$ distance, which shows (as a result of unrestrained refinement) a typical separation of 0.91 (2) $\AA$. Thus, these results indicate an increase in hydrogen-bonding strength due to the presence of chlorine atom. In fact, the presence of the chlorine atom favours the formation of weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions between neighboring molecules, which link them into 1-D extended chains along the $a$ axis and help to stabilize the chain.
The chains are linked along the c direction by $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ interactions [2.902 (2) $\AA$ ]. This interaction involves contacts between an apparently electron deficient aromatic $\mathrm{C} 6-\mathrm{H} 6$ and the chlorine atom from a second molecule. The phenyl group in both molecules lies in an orientation which favours hydrogen bond formation.
In the title compound, $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{O}_{2}$, the asymmetric unit contains one-half of the molecule, which is related to the other half by a twofold rotation axis [symmetry code: $-x, y,-z$ ] passing through C 1 (Figure 1). Unlike the related structures Rivera et al. $(2010,2009)$, the title compound crystallizes in a different crystal system and it has a chiral space group. The compound is a racemic twin and the absolute structure was determined on the basis of that of the starting amine whose stereochemistry is: trans-(rac)-1,2-cyclohexanediamine and the chiral centers were not affected when reacted.

## S2. Experimental

Preparation of title compound (I)
A solution of $(2 R, 7 R, 11 S, 16 S)-1,8,10,17$-tetraazapentacyclo[8.8.1.18,17.0 $\left.0^{2,7} .0^{11,16}\right]$ icosane ( $276 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) in dioxane $(3 \mathrm{ml})$ and water $(4 \mathrm{ml})$, prepared beforehand following previously described procedures, was added dropwise in a dioxane solution ( 3 ml ) containing two equivalents of $p$-chlorophenol ( $257 \mathrm{mg}, 2.00 \mathrm{mmol}$ ) in a two-necked roundbottomed flask. The mixture was refluxed for about 6 h until precipitation of a colourless solid. The resulting solid was collected by filtration, washed with cool methanol and dried under vacuum (yield $30 \%$, m.p. $=490-492 \mathrm{~K}$ ). Next, the racemic product ( $100 \mathrm{mg}, 0.246 \mathrm{mmol}$ ) was dissolved in 5 ml of a 4:1 mixture of chloroform: methanol. Single crystals of title compound ( $\mathbf{I}$ ) suitable for X-ray analysis were grown by slow evaporation of the solvent at room temperature over a period of about 2 weeks in a preferential crystallization (yield $46 \%$ ). 1 H NMR ( $\mathrm{CDCl}_{3}, 400 \mathrm{MHz}$ ): $\delta 1.29(4 H, \mathrm{~m}), 1.85$
$(2 H, \mathrm{~m}), 2.04(2 H, \mathrm{~m}), 2.34(2 H, \mathrm{~m}), 3.42\left(2 H, \mathrm{~d}, \mathrm{~J}=14.0 \mathrm{~Hz}, \mathrm{ArCH}_{2} \mathrm{~N}\right), 3.51\left(2 H, \mathrm{~s}, \mathrm{NCH}_{2} \mathrm{~N}\right), 4.14(2 H, \mathrm{~d}, \mathrm{~J}=14.0 \mathrm{~Hz}$, $\left.\mathrm{ArCH}_{2} \mathrm{~N}\right), 6.74(2 H, \mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz}), 6.92(2 H, \mathrm{~s}), 7.10(2 H, \mathrm{~d}, \mathrm{~J}=8.8 \mathrm{~Hz})$.

## S3. Refinement

All hydrogen atoms were discernible in difference Fourier maps and could be refined to reasonable geometry. According to common practice H atoms attached to C atoms were nevertheless kept in ideal positions during the refinement. The coordinates of the hydroxyl H atom were refined. The isotropic atomic displacement parameters of all hydrogen atoms were set to $1.2 * U_{\text {eq }}$ of the parent atom.

## Special details

Experimental. CrysAlisPro, Oxford Diffraction Ltd., Version 1.171.33.51 (release 27-10-2009 CrysAlis171 .NET) Analytical numeric absorption correction using a multifaceted crystal model based on expressions derived by Clark \& Reid (1995)
Physical Measurements
The melting point was determined with an Electrothermal apparatus, and it has not been corrected. IR spectrum was recorded as KBr pellets at 292 K on a Perkin-Elmer Paragon FT-IR instrument. NMR spectra were performed in $\mathrm{CDCl}_{3}$ at room temperature on a Bruker AMX 400 Advance spectrometer.
Refinement. The refinement was carried out against all reflections. The conventional $R$-factor is always based on $F$. The goodness of fit as well as the weighted $R$-factor are based on $F$ and $F^{2}$ for refinement carried out on $F$ and $F^{2}$, respectively. The threshold expression is used only for calculating $R$-factors etc. and it is not relevant to the choice of reflections for refinement.
The program used for refinement, Jana2006, uses the weighting scheme based on the experimental expectations, see _refine_ls_weighting_details, that does not force $S$ to be one. Therefore the values of $S$ are usually larger than the ones $\overline{\text { from the }} \overline{S H E L X}$ program.
