Received 19 August 2010; accepted 28 August 2010
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.027 ; w R$ factor $=0.067$; data-to-parameter ratio $=17.4$.

In the title compound, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{BrOS}$, the non- H and aromatic H atoms lie on a crystallographic mirror plane. In the crystal, molecules are linked into chains propagating along the $c$ axis by intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds.

## 1-(3-Bromo-2-thienyl)ethanone

M. Mahendra, H. K. Vivek, S. L. Gaonkar, B. S. Priya and S. Nanjunda Swamy

## S1. Comment

2-Acetyl-3-bromothiophene is one of the well-known bio-active intermediate used for the construction of number of new heterocycles (Lutz et al. 2005; Pelly et al. 2005). It is used as an intermediate for the synthesis of furo[3,2-a]carbazole alkaloid, furostifoline (Ito et al. 1990) and its derivatives, which show broad pharmacological properties (Yasuhara et al. 2002). Chalcones of 2-acetyl-3-bromothiophene exhibit promising anti-inflammatory, analgesic and antibacterial activities (Ashalatha et al. 2009). Acetyl thiophenes are useful as intermediates for preparing number of pharmaceutical compounds (Bando et al. 2010). Acetyl bromothiophenes are also used for the synthesis of number of biologically active pyridazine derivatives (Nakayama et al. 1989). With this background, the title compound (I), was synthesized and we report its crystal structure here.

The non-hydrogen and aromatic hydrogen atoms of the title molecule lie on a crystallographic mirror plane (Fig. 1). The molecules are linked into a chain along the $c$ axis by intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1).

## S2. Experimental

A three-necked, round-bottomed flask was charged with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{ml})$ and anhydrous $\mathrm{AlCl}_{3}(2.45 \mathrm{~g}, 18.4 \mathrm{mmol})$. The flask was cooled to 273 K . A dropping funnel was charged with freshly distilled acetyl chloride ( $1.48 \mathrm{~g}, 19.6 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{ml})$, and was added drop wise for a period of 30 min . The reaction mixture was stirred for 1 h at 273 K . The reaction mass was further cooled to 250 K .3 -Bromothiophene ( $1.00 \mathrm{~g}, 6.13 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{~mL})$ was added drop wise for 1 h . The reaction was stirred at 250 K for 30 min and then warmed slowly to room temperature and stirred for 1 h. Then the reaction mixture was quenched on ice water ( 50 ml ). Layers were separated and aqueous layer was repeatedly extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the combined organic extracts were washed with saturated $\mathrm{NaHCO}_{3}(25 \mathrm{ml})$, then brine ( 25 ml ) and finally dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Solvent was removed by distillation at atmospheric pressure. The remaining oily mass was distilled under high vacuum ( 403 K at 10 mbar ) to give a pale yellow oil which was crystallized in n-hexane to give 2-acetyl-3-bromothiophene ( $1.10 \mathrm{~g}, 88 \%$ ) as a yellow solid. Block-shaped yellow single crystals were obtained by slow evaporation of an $n$-hexane solution.

## S3. Refinement

H atoms were placed at idealized positions and allowed to ride on their parent atoms with $\mathrm{C}-\mathrm{H}$ distances in the range $0.93-0.96 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2-1.5 U_{\text {eq }}($ carrier atom $)$.

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.027$
$w R\left(F^{2}\right)=0.067$
$S=1.06$
973 reflections
56 parameters
0 restraints
Primary atom site location: structure-invariant direct methods

> Secondary atom site location: difference Fourier map
> Hydrogen site location: inferred from neighbouring sites
> H -atom parameters constrained
> $w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0333 P)^{2}+1.3829 P\right]$
> where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
> $(\Delta / \sigma)_{\max }=0.001$
> $\Delta \rho_{\text {max }}=0.68$ e $\AA^{-3}$
> $\Delta \rho_{\text {min }}=-0.48$ e $\AA^{-3}$

## Special details

Refinement. Refinement on $F^{2}$ for ALL reflections except those flagged by the user for potential systematic errors.
Weighted $R$-factors $w R$ and all goodnesses of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The observed criterion of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating - $R$-factor-obs etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$-factors based on ALL data will be even larger.
