## 3,9-Diisopropyl-2,4,8,10-tetrathiaspiro[5.5]undecane

Şerban Andrei Gâz, ${ }^{\text {a }}$ Ioana Dobra, ${ }^{\text {a }}$ Adrian Woiczechowski-Pop, ${ }^{\text {a }}$ Richard A. Varga ${ }^{\text {b }}$ and Ion Grosu ${ }^{\text {a }}$<br>${ }^{\text {a }}$ Organic Chemistry Department, CCSOOM, Faculty of Chemistry and Chemical Engineering, 'Babes-Bolyai' University, Arany Janos Street 11, RO-400028 Cluj Napoca, Romania, and ${ }^{\mathbf{b}}$ Faculty of Chemistry and Chemical Engineering, 'BabesBolyai' University, Arany Janos Street 11, RO-400028 Cluj Napoca, Romania Correspondence e-mail: igrosu@chem.ubbcluj.ro

Received 27 August 2010; accepted 17 September 2010
Key indicators: single-crystal X-ray study; $T=297 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.006 \AA$; $R$ factor $=0.068 ; w R$ factor $=0.153$; data-to-parameter ratio $=17.9$.

The molecule of the title compound, $\mathrm{C}_{13} \mathrm{H}_{24} \mathrm{~S}_{4}$, has $C 2$ symmetry and it crystallizes as a racemate. The structure displays two six-membered rings exhibiting chair conformations, with the isopropyl substituents in equatorial positions. In the crystal structure, weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{S}$ interactions are observed, leading to a channel-like arrangement along the $c$ axis.

## S1. Comment

Despite the rich literature dealing with spiro compounds (Cismaş et al., 2005; Eliel \& Wilen, 1994; Grosu et al., 1995, 1997; Terec et al., 2001, 2004) new papers were written recently especially including spiro derivatives having sulfur or selenium heteroatoms. Only few spirans bearing 1,3 dithiane units were reported (Backer \& Evenhuis, 1937; Gâz et al., 2008; Mitkin et al., 2001) and only 2 crystals were obtained so far (Zhou et al., 2001). The title compound (Fig. 1) exhibits a $C 2$ symmetry unit with chair conformation for both six-membered rings.
Due to the space arrangement there are differences between positions 2,4 and $2^{\prime}, 4^{\prime}$. Due to these differencies positions 4 and $4^{\prime}$ which are oriented towards the other 1,3-dithiane ring are named methylene inside, while the other two $\mathrm{CH}_{2}$ groups (positions 2 and $2^{\prime}$ ) are oriented in opposite direction and they are named methylene outside groups.
In the crystal packing (Fig. 2 and Fig. 3) the sulfur atom from a neighbour molecule is hydrogen-bonded (weak interactions) via a intermolecular $\mathrm{C} 7-\mathrm{H} 7 \mathrm{c} \cdots \mathrm{S} 1$ connection (Table 1).

These weak interactions stabilize the lattice and form a three-dimensional network as a channel-like arrangement along the $c$ axis.

## S2. Experimental

The synthesis of I has been described elsewhere (Gâz et al., 2008). Crystal were obtained from dichloromethane, by slow evaporation at room temperature.

## S3. Refinement

All hydrogen atoms were placed in calculated positions using a riding model, with $\mathrm{C}-\mathrm{H}=0.93-0.97 \AA$ and with $U_{\text {iso }}=$ $1.5 U_{\text {eq }}(\mathrm{C})$ for H . The methyl groups were allowed to rotate but not to tip.

Figure 1
ORTEP digram of the title compound, with the atom-numbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level and H atoms are shown as small spheres of arbitrary radii.

Figure 2
A view of the molecular structure exhibiting the hydrogen bonding interactions.

Figure 3
The crystal packing viewed along $c$ axis, exhibiting channel-like arrangement formed most probably by weak interaction between the methyl group H atoms and the sulfur atom from a neighbour molecule.

$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\max }=0.36$ e $\AA^{-3}$
$\Delta \rho_{\text {min }}=-0.28$ e $\AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
