Received 8 September 2010; accepted 13 September 2010

Key indicators: single-crystal X-ray study;  $T = 173\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.038;  $wR$  factor = 0.100; data-to-parameter ratio = 12.7.

The structure of the title compound,  $C_{26}H_{29}NO_7$ , at 173 K has an intermolecular  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bond. This is one of the few examples where a mono-ketone pentacycloundecane (PCU) molecule exhibits hydrogen bonding in the solid state. The dihedral angles of the amide and ester groups are normal and unaffected by the cage structure. A longer than normal  $\text{C}-\text{C}$  bond [1.571 (4)  $\text{\AA}$ ] was found within the cage structure.

### S1. Comment

Pentacycloundecane (PCU) derivatives have been reported in a wide range of chemical fields (Marchand, 1989). We have reported the structures of a number of PCU derivatives including a mono-ketone ethylene acetal (Kruger *et al.*, 2006). Previous examples of this group of mono-ketone molecules have included crown ether (Watson *et al.*, 2000), nitro derivatives (Flippen-Anderson *et al.*, 1991) and benzylic amines (Liu *et al.*, 2001). The title compound (Fig. 1) is a rare example of a monoketone PCU with an intermolecular hydrogen bonding interaction and also features a PCU cage ester bond (Watson *et al.*, 2000). The intermolecular N1—H···O1 bond interaction (2.882 Å) holds the structure in interdigitated rows. The intermolecular distances between the ring centroids in the *a* axis direction of 5.641–7.710 Å, suggests that there is no  $\pi$ -stacking interaction between parallel molecules (Fig. 2).

### S2. Experimental

5-Hydroxy-4-oxahexacyclo[5.4.0.0<sup>2,6</sup>.0<sup>3,10</sup>.0<sup>5,9</sup>]dodecane-3-carboxybenzylester (1.0 g, 3.2 mmol) (Martins *et al.*, 1993) was dissolved in dichloromethane (15 ml) and reacted, under stirring, with BOC-glycine (1.2 g, 6.4 mmol), diisopropyl-carbodiimide (0.7 ml, 6.4 mmol), and DMAP (0.04 g, 0.32 mmol) overnight at ambient temperature. The resulting solution was washed with HCl (0.1 N) and water and then extracted with ethyl acetate. The organic layer was dried  $\text{Na}_2\text{SO}_4$ , filtered, and concentrated under vacuum. The product was isolated by silica flash column chromatography (15% ethyl acetate in hexane) to give the product, (0.6 g, 60% yield). Crystallization of the product was carried out by dissolving the product in 5 ml a solvent mixture of ethyl acetate and hexane (1:5) at 22 °C.

### S3. Refinement

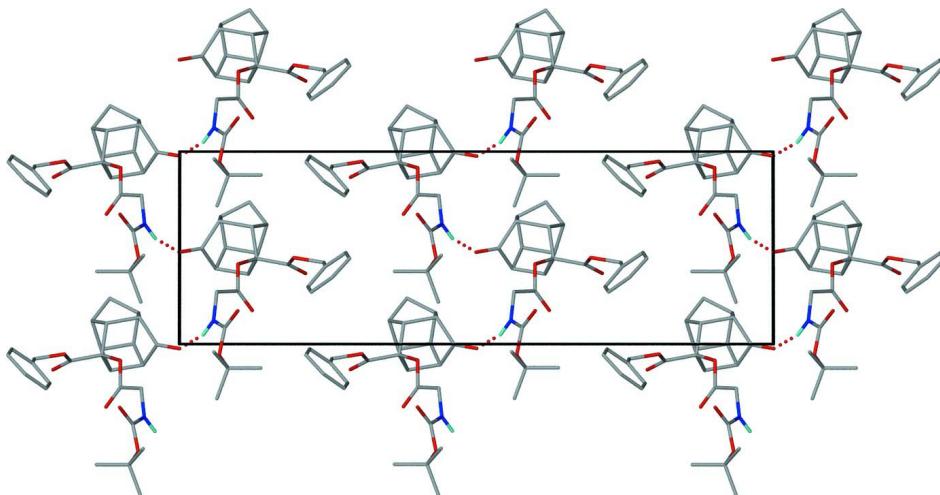

All non-hydrogen atoms were refined anisotropically. All hydrogen atoms, except H1N on N1, were positioned geometrically with C—H = 0.95 - 1.00 Å and refined as riding on their parent atoms with  $U_{\text{iso}}$  (H) = 1.2 - 1.5  $U_{\text{eq}}$  (C). The

hydrogen atom H1N was located in a difference electron density maps and refined with simple bond length constraints.

**Figure 1**

Molecular structure of the title compound showing the numbering scheme. All non-hydrogen atoms are shown as ellipsoids with probability level of 30%.

**Figure 2**

Partial projection viewed along [100]. All hydrogen atoms except the hydrogen H1N on N1 are omitted. The hydrogen bonds are shown as dotted lines.

### Special details

**Experimental.** Half sphere of data collected using SAINT strategy (Bruker, 2006). Crystal to detector distance = 50 mm; combination of  $\varphi$  and  $\omega$  scans of  $0.5^\circ$ , 40 s per  $^\circ$ , 2 iterations.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
