Received 28 September 2010; accepted 8 October 2010
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.033 ; w R$ factor $=0.089$; data-to-parameter ratio $=14.6$.

In the title salt, $\left(\mathrm{C}_{7} \mathrm{H}_{11} \mathrm{~N}_{2}\right)\left[\mathrm{Cr}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$, the asymmetric unit contains one half-cation and one half-anion. The Cr atom, the C and N atoms involved in $\mathrm{C}-\mathrm{N}$ (exocyclic) bonding and the N and H atoms of $\mathrm{N}-\mathrm{H}$ groups lie on twofold rotation axis. The $\mathrm{Cr}^{\mathrm{III}}$ atom of the complex anion is six-coordinated in a distorted $(4+2)$ octahedral geometry with four equatorial O atoms of two nearly coplanar oxalate and two quasi-axial aqua O atoms. In the crystal, the protonated N atoms of the pyridine rings are hydrogen bonded to the carbonyl O atoms of the anions, forming chains along [010]. These chains are connected by lateral $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, stabilizing the structure.

## S1. Comment

The coordination chemistry of oxalate $\left(\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}\right)$ continues receiving considerable attention, due to the ability of this ion to act as a remarkably flexible ligand system in complexations with a wide range of metal ions [Martin et al.,2007]. Recently, we published the structure of an organic-inorganic hybrid salt involving the quinolinium cation, $\left[\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{~N}\right]^{+}$and complex anion, $\left[\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{2}\right]^{-}$(Bélombé et al., 2009). We report here the crystal structure of a homologous salt, with 4-Dimethylaminopyridinium as the organic cation. The Fig. 1 shows the 4 -dimethylaminopyridinium cation, $\left[\mathrm{C}_{7} \mathrm{H}_{11} \mathrm{~N}_{2}\right]^{+}$, and the complex anion, $\left[\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\left(\mathrm{C}_{2} \mathrm{O}_{4}\right)_{2}\right]^{-}$.The asymmetric unit is formed by one-half cation and one-half anion. The geometrical parameters of the $\left[\mathrm{C}_{7} \mathrm{H}_{11} \mathrm{~N}_{2}\right]^{+}$cation are in agreement with those found in salts with the same cationic entity (Ghouili et al., 2010). The $\mathrm{Cr}^{\text {III }}$ ion of the complex anion adopts a distorted $(4+2)$ octahedral coordination involving four equatorial O atoms $\left(\mathrm{O} 2, \mathrm{O}^{\mathrm{i}}, \mathrm{O} 3, \mathrm{O}^{\mathrm{i}}\right)$ of two nearly coplanar oxalate and two quasi axial O atoms $\left(\mathrm{O} 1, \mathrm{O}^{i}\right)$ of water ligands (Fig. 1). The equatorial $\mathrm{Cr}-\mathrm{O}$ distances are 1.9706 (13) $\AA\left(\mathrm{Cr}-\mathrm{O}(2), \mathrm{Cr}-\mathrm{O}\left(2^{\mathrm{i}}\right)\right)$ and 1.9468 (13) $\AA(\mathrm{Cr}-\mathrm{O}(3), \mathrm{Cr}-$ $\left.\mathrm{O}\left(3^{\mathrm{i}}\right)\right)$ respectively, and are significantly shorter than the axial $\mathrm{Cr}-\mathrm{O}$ distance of $2.0055(14) \AA\left(\mathrm{Cr}-\mathrm{O}(1), \mathrm{Cr}-\mathrm{O}\left(1^{1}\right)\right)$. The bond distances in the complex anion are comparable with those reported for the quinolinium compound (Bélombé et al., 2009).In the crystal structure, intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ (carbonyl) hydrogen bonds connect the ionic entities, generating layers parallel to [010]. These layers are further connected by lateral $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds,stabilizing the structure (Table 1, Fig. 2)

## S2. Experimental

A mixture of 4-dimethylaminopyridine ( $1 \mathrm{mmol}, 122.2 \mathrm{mg}$ ) and oxalic acid ( $2.2 \mathrm{mmol}, 277.2 \mathrm{mg}$ ) was dissolved in 30 ml of water. The filtered solution was stirred at 328 K and an aqueous solution ( 20 ml ) of $\mathrm{CrCl}_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}(1 \mathrm{mmol}, 266.5 \mathrm{mg})$ was added in successive small portions and stirred for 2 h continuously. The final red-violet solution obtained was left at room temperature and brown plate-like crystals suitable for X-ray diffraction were obtained after a few days.

## S3. Refinement

The H atoms were positioned geometrically, with $\mathrm{C}-\mathrm{H}, \mathrm{N}-\mathrm{H}$ distances of 0.96 and $0.86 \AA$ respectively, and constrained to ride on their parent atoms, with $U_{\text {iso }}(\mathrm{H})=1.5 \mathrm{Ueq}(\mathrm{C})$ and $1.2 \mathrm{Ueq}(\mathrm{N})$. The water H atoms were first located in a difference Fourier map and refined with distance restraints of $\mathrm{d}(\mathrm{O}-\mathrm{H} 1)=0.81(1)$ with all $U_{\text {iso }}(\mathrm{H})$ refined freely.

Figure 1
A view of the title compound with the atom-numbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level and H atoms are shown as small spheres of arbitrary radii. Unlabelled atoms are related two labeled atoms by the symmetry code for cation and anion are: $1-\mathrm{x}, \mathrm{y}, 1 / 2-\mathrm{z} ;-\mathrm{x}, \mathrm{y}, 1 / 2-\mathrm{z}$

Figure 2

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
