## $o$-Benzoquinone dioxime

## Giuliana Gervasio,* Domenica Marabello and Federica Bertolotti

Dipartimento di Chimica I.F.M.,University of Turin, Via P. Giuria 7, 10125, Torino, Italy
Correspondence e-mail: giuliana.gervasio@unito.it
Received 14 September 2010; accepted 4 October 2010
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.034 ; \omega R$ factor $=0.082$; data-to-parameter ratio $=4.7$.

The title compound, $\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{O}_{2}$, was obtained as a product of an in vitro study of the metabolism of benzofuroxan. The molecule exhibits a amphi configuration of the oxime groups $\mathrm{C}=\mathrm{N}-\mathrm{OH}$. One oxime group is involved in the formation of a strong intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond, while another links molecules into zigzag chains along the $c$ axis via intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds.

## $o$-Benzoquinone dioxime

## Giuliana Gervasio, Domenica Marabello and Federica Bertolotti

## S1. Comment

The title compound, o-benzoquinone dioxime, has been obtained according to Grosa et al. (2004). In the C1—C6 ring the $\mathrm{C} 3-\mathrm{C} 4$ and C5-C6 bond distances correspond to formal double bonds (1.336 (5) $\AA$ av.). Also the C1-N1 and C2-N2 distances agree with a double bond character (1.304 (5) $\AA$ av.). Noteworthy is the presence of a strong intramolecular hydrogen bond $\mathrm{O} 2-\mathrm{H} 2 \cdots \mathrm{~N} 2$ that probably stabilize the syn form of the dioxime. A further intermolecular hydrogen bond O1-H1..N2 forms chains of molecules. O-benzoquinone dioxime is known as an excellent ligand which forms bischelated transition metal complexes especially with the dipositive metal ions of the Ni triad (cf. Mégnamisi-Bélombé \& Endres, 1985).

## S2. Experimental

The $o$-benzoquinone dioxime has been otained according to Grosa et al. (2004)

## S3. Refinement

A very small and poorly diffracting crystal has been used; it was not possible to obtain a better crystal because it is a product of a metabolism. C-bound H atoms were placed in geometrically idealized positions ( $\mathrm{C}-\mathrm{H}=0.93 \AA$ ), and refined as riding, with $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$. Two O-bound H atoms were located on a difference map and refined isotropically. A restraint has been imposed on the planarity of the hexagonal ring. In the absence of any significant anomalous scatterers in the molecule, 368 Friedel pairs were merged before the final refinement.

> $\Delta \rho_{\text {max }}=0.19 \mathrm{e}^{-3}$
> $\Delta \rho_{\text {min }}=-0.13$ e $\AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
