# catena-Poly[[[tetraaquairon(II)]- $\mu-5,5^{\prime}-$ diazenediylditetrazolido] dihydrate] 

Bao-juan Jiao, ${ }^{\text {a }}$ Zhi-jun Yan, ${ }^{\text {a }}$ Guang Fan, ${ }^{\text {b }}$ San-ping Chen ${ }^{\text {c* }}$ and Sheng-li Gao ${ }^{\text {c }}$<br>${ }^{\text {a }}$ Department of Chemistry and Chemical Engineering, Xi'an University of Arts \& Science, Xi'an 710065, Shaanxi, People's Republic of China, ${ }^{\mathbf{b}}$ College of Chemistry and Chemical Engineering, Xianyang Normal University, Xianyang 712000, Shaanxi, People's Republic of China, and ${ }^{\text {c College of Chemistry and Materials Science, }}$ Northwest University, Xi'an 710069, Shaanxi, People's Republic of China Correspondence e-mail: sanpingchen@126.com

Received 25 September 2010; accepted 4 October 2010
Key indicators: single-crystal X-ray study; $T=273 \mathrm{~K}$; mean $\sigma(\mathrm{N}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.026 ; w R$ factor $=0.070$; data-to-parameter ratio $=10.0$.

In the title compound, $\left\{\left[\mathrm{Fe}\left(\mathrm{C}_{2} \mathrm{~N}_{10}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}\right\}_{n}$, the coordination geometry around the $\mathrm{Fe}(\mathrm{II})$ atom, which lies on a center of inversion, is distorted octahedral, with bonds to four O atoms and two N atoms. The azotetrazolate ligand displays a bridging coordination mode, forming an infinite zigzag chain. Intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonding and offset face-to-face $\pi-\pi$ stacking interactions [centroid-centroid distance $=3.4738(13) \AA$ ] lead to a three-dimensional network.

## S1. Comment

After Thiele prepared metallic salts of azotetrazole and claimed these for use in initiators, salts of AT ${ }^{2-}$ (AT $=5,5^{\prime}-$ azotetrazolate) have been extensively investigated and have often been considered for practical use as a class of energetic materials. We report here the crystal structure of the title compound, $\left[\mathrm{Fe}\left(\mathrm{C}_{2} \mathrm{~N}_{10}\right)\left(\mathrm{H}_{2} 0\right)_{4} \cdot 2 \mathrm{H}_{2} 0\right]_{\mathrm{n}}$, (I).
Single-crystal analysis shows that (I) exists as a one-dimensional infinite chain. As shown in Figure 1, the coordination geometry around $\mathrm{Fe}^{2+}$ cation can be described a disordered octahedral arrangement with coordination number of 6, where $\mathrm{O} 1, \mathrm{O} 2, \mathrm{O} 1 \mathrm{~A}$ and O 2 A form the equatorial plane, and axial positions are occupied by N 1 and N 1 A . Additionally, each $\mathrm{AT}^{2-}$ provides two terminal nitrogen atoms $(\mathrm{N} 1$ and N 1 A$)$ acting as bridging ligand to connect two $\left[\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]^{2+}$ to form an infinite zigzag chain.

In the crystal structure, the interactions of hydrogen bonding between the water molecules and the N atoms in the terazole rings, the off-set face to face $\pi-\pi$ stacking interactions of the terazole rings link the complex to a three dimensional structure, as shown in Figure 2.

## S2. Experimental

Brown block-like crystal for X-ray diffraction analysis was obtained from the mixture of $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{Fe}(\mathrm{SO} 4)_{2} .6 \mathrm{H}_{2} \mathrm{O}(0.392 \mathrm{~g}$, $1 \mathrm{mmol}), \mathrm{Na}_{2} \mathrm{AT} .5 \mathrm{H}_{2} \mathrm{O}(0.304 \mathrm{~g}, 1 \mathrm{mmol})$ and distilled $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{ml})$, which was allowed to evaporate at room temperature for one week.

## S3. Refinement

H atoms attached to O atoms were placed in calculated positions, with $\mathrm{O}-\mathrm{H}$ distances of $0.86 \AA$. The $U_{\text {iso }}(\mathrm{H})$ values were constrained to be -1.5 Ueq of the carrier atom.

Figure 1
A view of the molecular structure of (I) with the atom-labling scheme. Displacement ellipsoids are drawn at the 30\% probability level and H atoms are shown as small spheres of arbitrary radii.

Figure 2
Three dimensional network of the title complex.

$R_{\text {int }}=0.012$
$\theta_{\text {max }}=25.1^{\circ}, \theta_{\text {min }}=2.7^{\circ}$
$h=-7 \rightarrow 6$
$k=-7 \rightarrow 8$
$l=-8 \rightarrow 9$

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from
neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0447 P)^{2}+0.0115 P\right]$
where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\max }=0.007$
$\Delta \rho_{\text {max }}=0.24 \mathrm{e} \AA^{-3}$
$\Delta \rho_{\text {min }}=-0.35 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
