## $N$-[2-(Acetamido)ethyl]-2-hydroxybenzamide

## Michał Kozłowski, Wanda Radecka-Paryzek and Maciej Kubicki*

Department of Chemistry, Adam Mickiewicz University, Grunwaldzka 6, 60-780 Poznań, Poland
Correspondence e-mail: mkubicki@amu.edu.pl

Received 26 January 2011; accepted 28 January 2011
Key indicators: single-crystal X-ray study; $T=90 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA ; R$ factor $=$ $0.058 ; w R$ factor $=0.162$; data-to-parameter ratio $=15.4$.

In the title molecule, $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}$, an intramolecular O $\mathrm{H} \cdots \mathrm{O}$ hydrogen bond closes an almost planar [maximum deviation $=0.022$ (13) A] six-membered ring and enforces the cis conformation of the keto group with respect to the hydroxy substituent. In the crystal, intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the moleclues into ribbons extended along [110]. Weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions further consolidate the crystal packing.

## Related literature

## S1. Comment

Ribonucleic acid, which mediates genetic information encoded in DNA, is one of the most important compounds in life. If only one RNA can be chosen from many RNAs in cells and selectively cleaved at desired site, it opens the way to new RNA science (e.g. regulation of expression of a specific gene, advanced therapy, RNA manipulation) (Kuzuya et al., 2006). During the past decade, mimics for RNA-cleaving enzymes, ribonucleases, have received special attention (Nüttymäki et al., 2006). The first artificial nucleases capable of cleaving RNA oligonucleotides in a selective manner were DNA conjugates of lanthanide(III) ion complexes (Komiyama et al., 1999; Franklin, 2001; Morrow et al., 2004). The title compound (I, Scheme 1) was isolated during efforts to prepare new synthetic ribonuclease precursors as part of our research program involving the study of the nonselective and selective hydrolysis of RNA by lanthanide complexes.
The conformation of the CNCCNCC chain in (I) is $\operatorname{tg}^{+} \operatorname{tg}-t(t-t r a n s, g-g a u c h e)$, as can be seen from the values of the torsion angles. Intramolecular hydrogen bond between hydroxy group and O7 oxygen atom causes closing of the sixmembered nearly planar (within 0.022 (13) $\AA$ ) ring (Fig. 1). This bond is strong and causes the changes in the geometry of involved fragments: lengthening of both $\mathrm{O}-\mathrm{H}(1.11(4) \AA)$ and $\mathrm{C}=\mathrm{O}(1.255(3) \AA)$ bonds. This ring is almost coplanar with the phenyl ring plane, the dihedral angle between the two planes is $1.6(9)^{\circ}$. In the Cambridge Structural Database (Allen, 2002; Version 5.31 of Nov. 2009, updated August 2010) there are 229 fragments of 2-hydroxy-N-monosubstituted- benzamide, and both $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ (with hydroxy group as an acceptor) are almost equally represented in the sample. Of course, the different hydrogen bond schemes are connected with the different $\mathrm{C} 1-\mathrm{C} 2-\mathrm{C} 7$ —N8 torsion angles, which are close to $180^{\circ}$ for the former and close to $0^{\circ}$ for the latter possibility (cf. Fig. 2). The overall conformation of the molecule can be described as two almost planar (within 0.022 (2) $\AA$ ) and nearly parallel (the dihedral angle is $\left.5.65(16)^{\circ}\right)$ fragments $\mathrm{C} 1 \cdots \mathrm{C} 9$ and $\mathrm{C} 10 \cdots \mathrm{C} 13$.
In the crystal structure, the variety of hydrogen bonds connects the molecules of I into the hydrogen-bonded chains of molecules (cf. Table 1). The pairs of almost linear $\mathrm{N} 11 — \mathrm{H} 11 \cdots \mathrm{O} 7(1-x, 2-y, 1-z)$ and $\mathrm{N} 8 — \mathrm{H} 8 \cdots \mathrm{O} 12(2-x, 1-y, 1-z)$ hydrogen bonds join the molecules in centrosymmetric dimers, the graph set connected with these interactions are $R^{2}{ }_{2}(14)$. Each of these bonds is accompanied by secondary however still relatively short and directional $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions (Table 1). As can be seen in Fig. 3 these bonds in general join two different "storeys" of the molecules in alternating manner. Therefore these interactions create the double ribbons of molecules which expand approximately along [-110] direction. The interactions between these motifs are only very week.

## S2. Experimental

To a solution of ethylenediamine $(0,3972 \mathrm{~g}, 2 \mathrm{mmol})$ in THF $(7 \mathrm{ml}) O$-acetylsalicyloyl chloride $(0,268 \mathrm{ml}, 4 \mathrm{mmol})$ in THF ( 7 ml ) was added dropwise with stirring. The reaction was carried out for 24 h in ambient temperature. The reaction mixture was evaporated to dryness and purified by silica gel column chromatography by elution with $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ methanol (98:2). Crystals suitable for X-ray diffraction analysis were formed by slow evaporation from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ methanol (1:1) after
one week.
ESI-MS m/z (\%) = $221\left(100\left\{\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{~N}_{2} \mathrm{O}_{3}^{-}\right\}\right) ; 245\left(100\left\{\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}+\mathrm{Na}^{+}\right\}\right)$.

${ }^{1}$ H-NMR p.p.m.: $12.46(s) ; 7.90(s) ; 7.48(d) ; 7.38(t) ; 6.98(d) ; 6.89(t) ; 6.10(s) ; 3.56(t) ; 2.05(s)$.

## S3. Refinement

C-bound H atoms were geometrically positioned ( $\mathrm{C}-\mathrm{H} 0.95-0.99 \AA$ ) and refined as riding, with Uiso $(\mathrm{H})=1.2-1.5$
$\mathrm{Ueq}(\mathrm{C})$. The rest H atoms were found in the diffrence Fourier maps and isotropically refined.

## Figure 1

View of I showing the atomic numbering and 50\% probability displacement ellipsoids. Hydrogen atoms are depicted as spheres with arbitrary radii. Intramolecular hydrogen bond is shown as dashed line.

(a)

(b)

## Figure 2

Two views: $(a)$ face-on and $(b)$ side-on of the hydrogen-bonded chain of molecules of $\mathbf{I}$. Hydrogen bonds are shown as dashed lines.

## Figure 3

A portion of the crystal packing as seen approximately along $b$-direction. Hydrogen bonds are shown as dashed lines.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
