## ( $\boldsymbol{\eta}^{4}$-s-cis-1,3-Butadiene)tetracarbonylchromium(0)

## Guido J. Reiss* and Maik Finze

Institut für Anorganische Chemie und Strukturchemie, Lehrstuhl II: Material- und Strukturforschung, Heinrich-Heine-Universität Düsseldorf, Universitätsstrasse 1, D-40225 Düsseldorf, Germany
Correspondence e-mail: reissg@uni-duesseldorf.de

Received 31 January 2011; accepted 7 February 2011

Key indicators: single-crystal X-ray study; $T=137 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.028 ; w R$ factor $=0.068$; data-to-parameter ratio $=12.4$.

In the title complex, $\left[\mathrm{Cr}\left(\mathrm{C}_{4} \mathrm{H}_{6}\right)(\mathrm{CO})_{4}\right]$, the $\mathrm{Cr}^{0}$ atom shows a distorted octahedral environment from four C atoms of the carbonyl ligands and the two $\pi$-bonds of the $s$-cis- 1,3 butadiene ligand. The complex has an approximate noncrystallographic mirror symmetry $m$ passing through the chromium atom, two carbonyl ligands and the mid-point of the central $\mathrm{C}-\mathrm{C}$ bond of the $s$-cis-1,3-butadiene ligand. The $\mathrm{C}-\mathrm{C}$ bond lengths in the $s$-cis-1,3-butadiene ligand alternate, the terminal distances being shorter than the central distance.

## ( $\boldsymbol{\eta}^{4}$-s-cis-1,3-Butadiene)tetracarbonylchromium (0)

Guido J. Reiss and Maik Finze

## S1. Comment

Simple butadiene complexes of transition metals are of general interest because they are model systems that allow a deeper understanding of the bonding situation between transition metal centers and olefins that play an important role for example in catalysis. $\left[\mathrm{Cr}\left(\mathrm{C}_{4} \mathrm{H}_{6}\right)(\mathrm{CO})_{4}\right]$ that was first described in the 70 s of the last century (Fischler et al. 1976) was subject to a number of spectroscopic (Kotzian et al. 1982) as well as theoretical studies (von Ragué Schleyer et al. 2000) and its chemistry was investigated (Kreiter \& Özkar, 1978; Okamoto et al. 1991) with the focus on photochemical ligand exchange reactions (Fischler et al. 1976).
The coordination at $\mathrm{Cr}(0)$ in the title compound is best described as a distorted octahedron formed by four carbonyl ligands and one s-cis-1,3-butadiene ligand. The $\mathrm{Cr}-\mathrm{CO}$ distances of the carbonyl ligands that are trans to the $s$-cis-1,3butadiene ligand are slightly shorter than the two other $\mathrm{Cr}-\mathrm{CO}$ distances (Table 1). This finding is in good agreement to $\mathrm{Cr}-\mathrm{CO}$ distances in the structure of the related tetracarbonyl chromium $(0)$ complex $\left[\mathrm{Cr}\left(\mathrm{C}_{19} \mathrm{H}_{23} \mathrm{NO}_{2}\right)(\mathrm{CO})_{4}\right]: d(\mathrm{Cr}-$ $\left.\mathrm{CO}_{\text {trans }}\right)=1.884(4), 1.887(6) \AA$ and $d(\mathrm{Cr}-\mathrm{CO})=1.847(5), 1.837$ (4) $\AA($ Pavkovic $\&$ Zaluzec, 1989). In the structure of the title complex the $\mathrm{Cr}-\mathrm{C}$ distances to the terminal carbon atoms of the $s$-cis-1,3-butadiene ligand are longer compared to the respective distances to the central carbon atoms of the diene ligand. A similar trend to longer $\mathrm{Cr}-\mathrm{C}$ distances for the terminal carbon atoms was found for example for the $s$-cis-1,3-butadiene chromium (1) complex [ $\mathrm{CrCp} *\left(\mathrm{C}_{4} \mathrm{H}_{6}\right)(\mathrm{CO})$ ] (Betz et al. 1993). As known from a few other chromium(0) complexes of $s$-cis-1,3-butadiene and related coordination compounds (Pavkovic \& Zaluzec, 1989; Betz et al. 1993; Wang et al. 1990; Konietzny et al. 2010) in [Cr( $\left.\left.\mathrm{C}_{4} \mathrm{H}_{6}\right)(\mathrm{CO})_{4}\right]$ the terminal $\mathrm{C}-\mathrm{C}$ distances are significantly shorter than the central $d(\mathrm{C}-\mathrm{C}) \Delta(d(\mathrm{C}-\mathrm{C}))=0.057-0.065 \AA$. In contrast, for comparable iron $(0)$ and manganese $(0)$ complexes almost equilibrated $\mathrm{C}-\mathrm{C}$ distances have been reported (Reiss, 2010; Reiss \& Konietzny 2002), e. g. in the structure of the $s$-cis-1,3-butadiene iron(0) complex $\left[\mathrm{Fe}\left(\mathrm{C}_{4} \mathrm{H}_{6}\right)(\mathrm{CO})_{3}\right] \Delta(d(\mathrm{C}-\mathrm{C}))=$ $0.005 \AA\left[d(\mathrm{C}-\mathrm{C})_{\text {central }}=1.4142(19) \AA, d(\mathrm{C}-\mathrm{C})_{\text {terminal }}=1.4194(14) \AA\right]$ (Reiss, 2010).

## S2. Experimental

## Synthesis

$\left[\mathrm{Cr}\left(\mathrm{C}_{4} \mathrm{H}_{6}\right)(\mathrm{CO})_{4}\right]$ was synthesized according to a published procedure (Fischler, 1976). The crystal was obtained by slow evaporation of a solution of pentane.

## S3. Refinement

All hydrogen atoms were located from difference Fourier synthesis. For the terminal H atom pairs of the $\mathrm{CH}_{2}$ groups common $U_{\text {iso }}(\mathrm{H})=0.031(4) / 0.027(4) \AA^{2}$ and individual $U_{\text {iso }}(\mathrm{H})=0.027(6)$ and $0.019(5) \AA^{2}$ for the two central H atoms were refined freely with distances in the range 0.90 (2) - 0.98 (3) $\AA$.

Figure 1
Hydrogen atoms are drawn with an arbitrary radius and the displacement ellipsoids are shown at the $50 \%$ probability level.

> $(\Delta / \sigma)_{\max }=0.001$
> $\Delta \rho_{\text {max }}=0.29$ e $\AA^{-3}$
> $\Delta \rho_{\text {min }}=-0.38$ e $\AA^{-3}$

## Special details

Experimental. A single-crystal suitable for structure determination was harvested under a dry nitrogen atmosphere and was directly transferred into the cooling stream of an Oxford-Xcalibur diffractometer equipped with an EOS-CCD detector. CrysAlis PRO, Oxford Diffraction Ltd., Version 1.171.33.52 (release 06-11-2009). Numerical absorption correction based on Gaussian integration over a multifaceted crystal model.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
