# Poly[bis[ $\mu_{2^{-}}$-(dimethylazaniumyl)methylenediphosphonato]magnesium] 

Qiao-Sheng Hu, Xiao-Yu Deng, Yu-Hui Sun and Zi-Yi Du*<br>College of Chemistry and Life Science, Gannan Normal University, Ganzhou, Jiangxi 341000, People's Republic of China<br>Correspondence e-mail: ziyidu@gmail.com

Received 31 January 2011; accepted 17 February 2011
Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{N}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.024 ; w R$ factor $=0.066 ;$ data-to-parameter ratio $=13.0$.

The title compound, $\left[\mathrm{Mg}\left(\mathrm{C}_{3} \mathrm{H}_{10} \mathrm{NO}_{6} \mathrm{P}_{2}\right)_{2}\right]_{n}$, synthesized by a hydrothermal method, adopts a one-dimensional polymeric chain structure and is isotypic with the previously reported Cd complex based on the ligand $N, N$-dimethylaminomethane-1,1diphosphonic acid $\left(\mathrm{H}_{4} L\right)$. The asymmetric unit contains one half $\mathrm{Mg}^{2+}$ ion and one $\mathrm{H}_{3} L^{-}$anion. The unique $\mathrm{Mg}^{2+}$ ion lies on an inversion center and is octahedrally coordinated by O atoms from six phosphonate groups of four different $\mathrm{H}_{3} L^{-}$ anions. Each $\mathrm{H}_{3} L^{-}$anion, with one protonated N atom and two phosphonate OH groups, serves as a tridentate ligand. Two of its six phosphonate O atoms chelate to a $\mathrm{Mg}^{2+}$ cation in a bidentate fashion, while a third O atom bridges to a neighbouring $\mathrm{Mg}^{2+}$ ion. The interconnection of $\mathrm{Mg}^{2+}$ ions by the $\mathrm{H}_{3} L^{-}$anions leads to the formation of a polymer chain along the $a$ axis in which the adjacent $\mathrm{Mg}^{2+}$ ions are doubly bridged by two equivalent $\mathrm{H}_{3} L^{-}$anions. These discrete chains are further assembled into a three-dimensional supramolecular network via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds involving the non-coordinated phosphonate O atoms and the protonated N atoms.

## S1. Comment

Among many of the phosphonate ligands studied so far, methylenediphosphonic acid and its derivatives are quite unique because they feature a close connection of two phosphonate moieties via one carbon atom, which facilitate their combined coordination ability to act as a $\left[\mathrm{CP}_{2} \mathrm{O}_{6}\right]$ unit rather than two $\left[\mathrm{CPO}_{3}\right]$ units. As a result, they show diversified coordination capabilities with metal ions and thus lead to the formation of new structural types. Recently, by using such ligand types, i.e. $N, N$-dimethylaminomethane-1,1-diphosphonate, we have isolated a series of diphosphonate complexes of metals such as $\mathrm{Al}^{\mathrm{III}}, \mathrm{Fe}^{\mathrm{III}}, \mathrm{Cd}^{\mathrm{II}}, \mathrm{Pb}^{\mathrm{II}}$ and $\mathrm{Ba}^{\mathrm{II}}$, which exhibit variable structures such as zero-dimensional, onedimensional, double-1-dimensional, double-2-dimensional, and three-dimensional structures (Du et al., 2009, 2010a,b). As an expansion of our previous work, we have also obtained a one-dimensional magnesium(II) diphosphonate, namely $\left[\mathrm{Mg}\left(\mathrm{C}_{6} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{12} \mathrm{P}_{4}\right)\right]_{\mathrm{n}}$, which is isostructural with the previously reported cadmium(II) complex based on the same ligand and shows a one-dimensional chain structure. The asymmetric unit contains a half $\mathrm{Mg}^{2+}$ cation and one $\mathrm{H}_{3} L^{-}$anion. The unique $\mathrm{Mg}^{2+}$ cation lies on an inversion center and is octahedrally coordinated by the O atoms of six phosphonate groups from four $\mathrm{H}_{3} L^{-}$anions. The $\mathrm{Mg}-\mathrm{O}[2.0448(11)-2.1879(11) \AA$ ] bond lengths are comparable to those reported for other $\mathrm{Mg}^{\text {II }}$ phosphonate complexes (Lutz \& Muller, 1995; Distler et al., 1999; Stock \& Bein, 2004). The unique $\mathrm{H}_{3} L^{-}$anion, with one protonated N atom and two phosphonate OH groups, serves as a tridentate ligand. By using three of its six phosphonate O atoms, it chelates in a bidentate fashion with one $\mathrm{Mg}^{2+}$ cation and also bridges to a second $\mathrm{Mg}^{2+}$ ion. The interconnection of $\mathrm{Mg}^{2+}$ cations by the $\mathrm{H}_{3} L^{-}$anions leads to the formation of a one-dimensional chain along the $a$-axis, in which the adjacent $\mathrm{Mg}^{2+}$ ions are doubly bridged by two equivalent $\mathrm{H}_{3} L^{-}$anions. These discrete one-dimensional chains are further assembled into a three-dimensional supramolecular network via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds involving the non-coordinated phosphonate O atoms and the protonated N atoms.

## S2. Experimental

For the preparation of $(\mathrm{I})$, a mixture of $\mathrm{Mg}\left(\mathrm{NO}_{3}\right)_{2}(0.20 \mathrm{mmol})$ and $\mathrm{H}_{4} \mathrm{~L}(0.50 \mathrm{mmol})$ and ethanol $(3 \mathrm{ml})$ in 10 ml distilled water, was sealed into a Parr Teflon-lined autoclave ( 23 ml ) and heated at 393 K for 3 d . Colorless block-shaped crystals were collected in ca $55 \%$ yield based on Mg . Analysis calculated for $\mathrm{C}_{6} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{12} \mathrm{Mg}_{1} \mathrm{P}_{4}$ : C $15.65, \mathrm{H} 4.38, \mathrm{~N} 6.08 \%$; found: C 15.59, H 4.48, N 6.03\%.

## S3. Refinement

The N -bound and the tertiary C -bound H atoms were positioned geometrically and refined using a riding model: $\mathrm{N}-\mathrm{H}=$ 0.91 and $\mathrm{C}-\mathrm{H}=0.98 \AA$, with $\operatorname{Uiso}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{N}, \mathrm{C})$; while the O-bound and the primary C-bound H atoms were placed in idealized positions and constrained to ride on their parent atoms: $\mathrm{O}-\mathrm{H}=0.82$ and $\mathrm{C}-\mathrm{H}=0.96 \AA$, with $U_{\text {iso }}(\mathrm{H})$ $=1.5$ times $U_{\mathrm{eq}}(\mathrm{O}, \mathrm{C})$.

Figure 1
A view of the selected unit of (I), showing the atom-numbering scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level. Hydrogen atoms have been omitted for clarity. [Symmetry codes: (i) $x-1, y, z$; (ii) $-x+1,-y+1,-z+1$; (iii) $-x,-y+1,-z+1$; (iv) $x+1, y, z$.]

Figure 2
A view of the chain structure of (I) along the $a$-axis. The $\mathrm{CPO}_{3}$ tetrahedra are shaded in purple. $\mathrm{Mg}, \mathrm{N}$ and C atoms are drawn as cyan, blue and grey circles, respectively. Hydrogen atoms have been omitted for clarity.

## Figure 3

A view of the three-dimensional supramolecular structure of (I) down the $a$-axis. The $\mathrm{MgO}_{6}$ octahedra and $\mathrm{CPO}_{3}$ tetrahedra are shaded in cyan and purple, respectively. N, C and H atoms are drawn as blue, grey and green circles, respectively. Hydrogen bonds are represented by dashed lines.

## Special details

Experimental. IR data ( $\mathrm{KBr}, v, \mathrm{~cm}^{-1}$ ): $3437(m), 3137(s), 3071(m), 2986(m), 2826(m), 2280(m), 1815(m), 1473(m)$, $1457(m), 1421(m), 1388(m), 1256(s), 1225(s), 1200(v e r s u s), 1155(s), 1128(s), 1088(s), 1036(s), 995(s), 950(s)$, $928(\mathrm{~s}), 854(\mathrm{~m}), 827(\mathrm{~m}), 725(\mathrm{~m}), 615(\mathrm{~m}), 573(\mathrm{~s}), 517(\mathrm{~m}), 476(\mathrm{~m})$.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
