## $N, N^{\prime}$-Bis[(4-methylphenyl)sulfonyl]adipamide

Vinola Z. Rodrigues, ${ }^{\text {a }}$ Sabine Foro ${ }^{\text {b }}$ and B. Thimme Gowda ${ }^{\text {a }}$

${ }^{\text {a }}$ Department of Chemistry, Mangalore University, Mangalagangotri 574 199, Mangalore, India, and ${ }^{\mathbf{b}}$ Institute of Materials Science, Darmstadt University of Technology, Petersenstrasse 23, D-64287 Darmstadt, Germany
Correspondence e-mail: gowdabt@yahoo.com
Received 28 February 2011; accepted 1 March 2011
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.057 ; \omega R$ factor $=0.141$; data-to-parameter ratio $=15.2$.

In the centrosymmetric title compound, $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{~S}_{2}$, the $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds are trans to each other. In the crystal, intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}(\mathrm{S})$ hydrogen bonds link the molecules into zigzag chains running along the $b$ axis. The O atom involved in the hydrogen bond has a longer $\mathrm{S}-\mathrm{O}$ bond than the other O atom bonded to $\mathrm{S}[1.441$ (2) versus 1.428 (2) $\AA$ ] .

## $N, N^{\prime}$-Bis[(4-methylphenyl)sulfonyl]adipamide

Vinola Z. Rodrigues, Sabine Foro and B. Thimme Gowda

## S1. Comment

The sulfonamide moiety is a constituent of many biologically significant compounds. As a part of studying the effect of substituents on the structures of this class of compounds (Gowda et al., 2005, 2007; Rodrigues et al., 2011), in the present work, the structure of $N, N$-bis(4-methylphenylsulfonyl)-adipamide (I) has been determined (Fig.1). The asymmetric unit comprises half of a molecule, the remaining portion being generated via an inversion centre, similar to that observed in $\mathrm{N}, \mathrm{N}$-bis(2-methylphenylsulfonyl)-adipamide (II) (Rodrigues et al., 2011). The conformation of the $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds in the $\mathrm{C}-\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(\mathrm{O})-\mathrm{C}-\mathrm{C}$ segment is anti to each other and the amide O atom is also anti to the H atoms attached to the adjacent C atom. The molecule is bent at the S atom with the $\mathrm{C}-\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(\mathrm{O})$ torsion angle of $-58.5(3)^{\circ}$, compared to the value of $-63.7(4)^{\circ}$ in (II). Further, the $\mathrm{S} 1-\mathrm{N} 1-\mathrm{C} 7-\mathrm{C} 8$ and $\mathrm{C} 7-\mathrm{N} 1-\mathrm{S} 1-\mathrm{O} 2$ segments are nearly linear. The torsion angles $\mathrm{C} 2-\mathrm{C} 1-\mathrm{S} 1-\mathrm{N} 1$ and $\mathrm{C} 6-\mathrm{C} 1-\mathrm{S} 1-\mathrm{N} 1$ are, respectively, $-60.6(3)^{\circ}$ and $120.3(3)^{\circ}$. The corresponding values in (II) are $-71.3(4)^{\circ}$ and $106.9(4)^{\circ}$, respectively.

The dihedral angle between the planes of the benzene ring and the $\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(\mathrm{O})-\mathrm{C}-\mathrm{C}$ segment in (I) is $72.0(1)^{\circ}$, compared to the value of 89.9 (1) ${ }^{\circ}$ in (II).
$\mathrm{N}-\mathrm{H} \cdots \mathrm{O} 2(\mathrm{~S}) \mathrm{H}$-bond formation results in an $\mathrm{S}=\mathrm{O} 2$ bond longer than the $\mathrm{S}=\mathrm{O} 1$ bond. A series of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}(\mathrm{S})$ intermolecular hydrogen bonds (Table 1) link the molecules into infinite chains running in the $b$-axis direction (Fig. 2).

## S2. Experimental

$N, N$-Bis(4-methylphenylsulfonyl)-adipamide was prepared by refluxing a mixture of adipic acid ( 0.01 mol ) with $p$ toluenesulfonamide $(0.02 \mathrm{~mol})$ and $\mathrm{POCl}_{3}$ for 1 hr on a water bath. The reaction mixture was allowed to cool and added ether to it. The solid product obtained was filtered, washed thoroughly with ether and hot ethanol. The compound was recrystallized to the constant melting point and was characterized by its infrared and NMR spectra.
Needle like colorless single crystals used in the X-ray diffraction studies were grown by a slow evaporation of a solution of the compound in ethanol at room temperature.

## S3. Refinement

The H atom of the NH group was located in a difference map and later restrained to the distance $\mathrm{N}-\mathrm{H}=0.86$ (2) $\AA$. All other H atoms were positioned with idealized geometry using a riding model with aromatic $\mathrm{C}-\mathrm{H}$ distance $=0.93 \AA$, methylene $\mathrm{C}-\mathrm{H}=0.97 \AA$ and methyl $\mathrm{C}-\mathrm{H}=0.96 \AA$. All H atoms were refined with isotropic displacement parameters set to 1.2 times of the $U_{\text {eq }}$ of the parent atom.

Figure 1
Molecular structure of the title compound, showing the atom labelling scheme and displacement ellipsoids are drawn at the $50 \%$ probability level.

Figure 2
Packing diagram of the title compound with hydrogen bonding shown as dashed lines.

## Refinement

## Refinement on $F^{2}$

Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.057$
$w R\left(F^{2}\right)=0.141$
$S=1.08$
2122 reflections
140 parameters
1 restraint
Primary atom site location: structure-invariant
direct methods
$0.48 \times 0.12 \times 0.09 \mathrm{~mm}$

3355 measured reflections
2122 independent reflections
1651 reflections with $I>2 \sigma(I)$
$R_{\text {int }}=0.021$
$\theta_{\text {max }}=26.4^{\circ}, \theta_{\min }=3.1^{\circ}$
$h=-6 \rightarrow 7$
$k=-10 \rightarrow 7$
$l=-12 \rightarrow 12$

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0507 P)^{2}+0.6262 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.78 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-0.28$ e $\AA^{-3}$

## Special details

Experimental. CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
