Correspondence e-mail: gowdabt@yahoo.com
Received 12 April 2011; accepted 15 April 2011
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$;
$R$ factor $=0.035 ; w R$ factor $=0.086$; data-to-parameter ratio $=14.7$.

In the molecular structure of the title compound, $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{NO}_{3} \mathrm{~S}$, the $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds are anti to each other, while the amide H atom is syn with respect to the ortho-methyl group in the benzene ring. The $\mathrm{C}-\mathrm{S}-\mathrm{N}-\mathrm{C}$ torsion angle is $-58.2(2)^{\circ}$, indicating a twist in the molecule. In the crystal, $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules into chains along the $c$ axis.

## $\mathbf{N}$-(2-MethylphenyIsulfonyl)acetamide

K. Shakuntala, Sabine Foro and B. Thimme Gowda

## S1. Comment

The structures of sulfonamide drugs contain the sulfanilamide moiety (Maren, 1976). The hydrogen bonding preferences of sulfonamides has been investigated (Adsmond \& Grant, 2001). The nature and position of the substituents play a significant role on their crystal structures and other aspects of $N$-(aryl)-amides and $N$-(aryl)-sulfonamides (Gowda et al., 2003, 2004; Shakuntala et al., 2011). As a part of a study of the effects of substituents on the structures of this class of compounds, the structure of N -(2-methylphenylsulfonyl)-acetamide (I) has been determined (Fig. 1). The conformation of the $\mathrm{N}-\mathrm{C}$ bond in the $\mathrm{C}-\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(\mathrm{O})$ segment has gauche torsions with respect to the $\mathrm{S}=\mathrm{O}$ bonds, the torsion angles being $\mathrm{C} 7-\mathrm{N} 1-\mathrm{S} 1-\mathrm{O} 2=57.5(3)^{\circ}$ and $\mathrm{C} 7-\mathrm{N} 1-\mathrm{S} 1-\mathrm{O} 1=-174.5(2)^{\circ}$.
The $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds are anti to each other, similar to that observed in $N$-(phenylsulfonyl)-acetamide (II) (Gowda et al., 2010) and $N$-(2-chlorophenylsulfonyl)-acetamide (III) (Shakuntala et al., 2011). Further, the conformation of the amide-H atom is syn to the ortho-methyl group in the benzene ring, similar to that observed between the amide-H atom and the ortho-chloro group in (III). The molecule of (I) is bent at the $S$-atom with a $\mathrm{C}-\mathrm{S}-\mathrm{N}-\mathrm{C}$ torsion angle of -58.2 (2) ${ }^{\circ}$, compared to the values of -58.8 (4) ${ }^{\circ}$ in (II), and -71.7 (3) and 61.2 (3) ${ }^{\circ}$ in the two independent molecules of (III). In the crystal structure, intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1) link the molecules into chains along the $c$ axis; part of the crystal structure is shown in Fig. 2.

## S2. Experimental

The title compound was prepared by refluxing 2-methylbenzenesulfonamide ( 0.10 mole ) with an excess of acetyl chloride ( 0.20 mole ) for one hour on a water bath. The reaction mixture was cooled and poured into ice cold water. The resulting solid was separated, washed thoroughly with water and dissolved in warm dilute sodium hydrogen carbonate solution. The title compound was re-precipitated by acidifying the filtered solution with glacial acetic acid. It was filtered, dried and recrystallized from ethanol. Colourless rods of the title compound were obtained from a slow evaporation of its ethanol solution.

## S3. Refinement

The H atom of the NH group was located in a difference map and later restrained to the distance $\mathrm{N}-\mathrm{H}=0.86 \pm 0.02 \AA$. The other H atoms were positioned with idealized geometry using a riding model with the aromatic $\mathrm{C}-\mathrm{H}$ distance $=0.93$ $\AA$ and methyl $\mathrm{C}-\mathrm{H}=0.96 \AA$. All H atoms were refined with isotropic displacement parameters set to 1.2 times of the $U_{\text {eq }}$ of the parent atom.

Figure 1
Molecular structure of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50\% probability level.

Figure 2
View of the crystal packing in (I). Hydrogen bonds are shown as dashed lines.

$l=-17 \rightarrow 20$

Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0453 P)^{2}+0.1227 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}=0.016$
$\Delta \rho_{\max }=0.14 \mathrm{e}^{-3}$
$\Delta \rho_{\text {min }}=-0.17$ e $\AA^{-3}$
Absolute structure: Flack (1983), 824 Friedel pairs
Absolute structure parameter: 0.03 (9)

## Special details

Experimental. CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
