Received 8 March 2011; accepted 26 March 2011

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å;
R factor = 0.034; wR factor = 0.095; data-to-parameter ratio = 16.7.

In the polymeric title complex, $[\text{Mn}(\text{C}_9\text{H}_9\text{O}_2\text{S})_2(\text{C}_{10}\text{H}_8\text{N}_2)(\text{H}_2\text{O})_2]_n$, the Mn^{2+} cation and the 4,4'-bipyridine ligand lie on a twofold rotation axis. The cation has an MnN_2O_4 octahedral environment, being coordinated by the O atoms of two water molecules and two monodentate (4-tolylsulfanyl)acetate anions, and by two N atoms of two 4,4'-bipyridine ligands. The latter bridge adjacent cations into linear chains parallel to [010]. The chains are further linked with each other into a two-dimensional network parallel to (100) via intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds.

Xiao-Yong Zheng

S1. Comment

The title complex, (I), is isotypic with the Ni²⁺ (Lin *et al.*, 2006), Co²⁺ (Zheng *et al.*, 2006) and Cd²⁺ analogues (Cai *et al.*, 2008).

The structure of (I) (Fig. 1) consists of linear polymeric chains parallel to [010]. The chains are formed through 4,4'-bipyridine ligands bridging the Mn²⁺ cations. The latter are in a slightly distorted MnN₂O₄ octahedral coordination environment defined by four O atoms of pairs of water molecules and monodentate (4-tolylsulfanyl)acetate anions. Intermolecular O—H...O hydrogen bonding between the water molecules and the carboxylate O atoms link neighboring chains into a two-dimensional network parallel to (100).

In comparison with the isotypic structures, the structural parameters are very similar; as expected, the metal—N and metal—O bond lengths differ slightly due to the differences of the ionic radii of Cd²⁺, Co²⁺, Mn²⁺ and Ni²⁺.

S2. Experimental

Mn(CH₃COO)₂·4H₂O (0.132 g, 0.5 mmol), (4-tolylsulfanyl)acetic acid (0.091 g, 0.5 mmol), 4,4'-bipyridine (0.039 g, 0.25 mmol) and water (18 ml) were sealed in a 25 ml Teflon-lined stainless-steel reactor. The solution was heated at 433 K for 72 h and then cooled to room temperature over a period of 72 h. Yellow crystals suitable for X-ray analysis were obtained.

S3. Refinement

The methyl groups were allowed to rotate with C—H = 0.96 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$; the other H atoms were positioned geometrically [aromatic C—H = 0.93 Å and aliphatic C—H = 0.97 Å, $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$]. Water H atoms were located from difference Fourier maps and were refined with distance restraints of O—H = 0.85 Å and H...H = 1.30 Å; their displacement parameters were set to $1.2U_{\text{eq}}(\text{O})$.

Figure 1

A view of part of the title structure, showing 30% probability displacement ellipsoids. [Symmetry codes: (A) $-x, y, -z + 1/2$; (B) $x, y + 1, z$; (C) $x, y - 1, z$.]

Figure 2

The chain structure of the title compound. All H atoms have been omitted for clarity.

 $\Delta\rho_{\min} = -0.27 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
