Received 15 April 2011; accepted 17 April 2011
Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.039 ; w R$ factor $=0.123$; data-to-parameter ratio $=8.3$.

In the title compound, $\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{~N}_{3} \mathrm{O}_{3}$, the 3-diazo-2-oxopropanamide section of the molecule is nearly planar, with a maximum deviation of 0.025 (1) $\AA$ from the mean plane of its constituent atoms. The diazo $\mathrm{C}=\mathrm{N}=\mathrm{N}$ angle is 178.0 (3) ${ }^{\circ}$. In the crystal, pairs of intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules into infinite double chains along the [100] direction. The double chains are additionally stabilized by weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contacts with $\mathrm{C} \cdots \mathrm{O}$ distances of 3.039 (3) $\AA$. Neighboring double chains in turn interact with each other through $\pi-\pi$ stacking interactions [centroid-centroid distance of the 3-diazo-2oxopropanamide units $=3.66(6) \AA$ ] to form infinite stacks along the $b$ axis. Molecules from neighboring stacks interdigitate with each other in the $c$-axis direction, thus leading to an interwoven three-dimensional network held together by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}, \mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions and $\pi-\pi$ stacking.

## 3-Diazo- N -[(2S)-1-hydroxypropan-2-yl]-2-oxopropanamide

Xiao-na Chen, Wen-hao Hu, Xiao-liu Li and Hua-dong Xu

## S1. Comment

Diazo refers to a type of organic compounds that have two linked nitrogen atoms as a terminal functional group. The simplest example of a diazo compound is diazomethane. The electronic structure of diazo compounds involves a positive charge on the central nitrogen and negative charge distributed between the terminal nitrogen and the carbon. The diazo compounds have wide applications in organic synthesis, such as $\mathrm{C}-\mathrm{H}$ or $\mathrm{C}-\mathrm{N}$ bonds insertion, 1,3-dipolar cyclization and transition metal complexes catalyzed transformations (Doyle \& Forbes, 1998; Zhang \& Wang, 2008; Doyle, 1986). To investigate the relationship between structure and reactivity, the title compound was synthesized and its structure was determined by X-ray diffraction. In this article, we present the synthesis and crystal structure of this new diazo compound.

As shown in figure 1, the 3-diazo-2-oxopropanamide section of the molecule is nearly planar with a maximum deviation of 0.025 (1) $\AA$ from the mean plane of its constituting atoms. The diazo unit is almost linear with an C5-N2-N3 angle of 178.0 (3) $)^{\circ}$. The $\mathrm{N} 2-\mathrm{N} 3, \mathrm{C} 4-\mathrm{O} 2$ and C5-O3 bond length of 1.113 (3), 1.215 (3) and 1.213 (3) Å, respectively, indicate the presence of a typical $\mathrm{N}=\mathrm{N}$ and $\mathrm{C}=\mathrm{O}$ bonds. Whereas the $\mathrm{C} 1-\mathrm{O} 1[1.396$ (3) $\AA$ ] and $\mathrm{C} 2-\mathrm{N} 1[1.468(2) \AA]$ bond lengths correspond to typical single bonds.
In the crystal structure, it is noteworthy that pairs of intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules into infinite double chains along the $\left[\begin{array}{lll}1 & 0 & 0\end{array}\right]$ direction. The double chains are further stabilized by weak C $\mathrm{H} \cdots \mathrm{O}$ contacts with the $\mathrm{C} \cdots \mathrm{O}$ distances of 3.039 (3) $\AA$ (Fig. 2). Neighboring double chains are in turn interacting with each other through $\pi-\pi$ stacking interactions [centroid to centroid distances of the 3-diazo-2-oxopropanamide units are $3.66(6) \AA]$ to form infinite stacks along $b$. Molecules from neighboring stacks interdigitate with each other in the $c$ direction, thus leading to an interwoven three dimensional network held together by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}, \mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions and $\pi-\pi$ stacking.

## S2. Experimental

To a dried flame-dried 20 ml three-necked round bottomed flask filled with nitrogen and equipped with a refluxing condenser was added diazo ethyl pyruvate ( $0.5 \mathrm{~g}, 3.5 \mathrm{mmol}$ ), ( S )-2-aminopropan-1-ol ( $0.345 \mathrm{~g}, 4.6 \mathrm{mmol}$ ) in 10 ml anhydrous ethanol. This suspension was stirred at room temperature and the reaction was monitored by TLC. When the diazo ethyl pyruvate was consumed, the yellow brown reaction mixture was concentrated to dryness. The crude product was purified by column chromatography on silica gel with petroleum ether/ethyl acetate $(1 / 1)$ as eluent to give the product in yield of $63 \%(0.377 \mathrm{~g}, 2.2 \mathrm{mmol})$. Single crystals suitable for X-ray diffraction study were obtained by recrystallization of the crude from a diethyl ether solution. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right), \delta($ p.p.m. $): 6.36(\mathrm{~s}, 1 \mathrm{H}), 4.05(\mathrm{br}$, $1 \mathrm{H}), 3.69(\mathrm{~m}, 1 \mathrm{H}), 3.61(\mathrm{~m}, 1 \mathrm{H}), 2.25(\mathrm{br}, 1 \mathrm{H}), 1.61(\mathrm{~s}, 1 \mathrm{H}), 1.24(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right), \delta$ (p.p.m.): 181.64, 159.86, 65.38, 54.99, 47.65, 16.42; IR (KBr pellet, $v, \mathrm{~cm}^{-1}$ ): 3327, 3083, 2110, 1733, 1666, 1536, 1381, 788, 706.

## S3. Refinement

All H atoms were placed in idealized positions ( $\mathrm{C}-\mathrm{H}=0.93-0.98 \AA, \mathrm{~N}-\mathrm{H}=0.86 \AA, \mathrm{O}-\mathrm{H}=0.82 \AA$ ) and refined as riding atoms with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C}, \mathrm{N})$ and with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{O})$. The methyl H atoms were set based on angle considerations (AFIX 33 instruction in SHELXL97 (Sheldrick, 2008)). In the absence of significant anomalous scattering effects, 572 Friedel pairs were averaged prior to the final refinement.

## Figure 1

The molecular structure of the title compound, with displacement ellipsoids at the $30 \%$ probability level.

Figure 2
Part of infinite double chains structure of the title compound, linked via hydrogen bonds (dashed lines) extending in the $\left[\begin{array}{lll}1 & 0 & 0\end{array}\right]$ direction. H atoms have been omitted for clarity, except for those involved in hydrogen-bonding interactions.

Figure 3
The $\pi-\pi$ stacking interactions in the structure of the title compound.

$\Delta \rho_{\text {min }}=-0.14 \mathrm{e} \AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
