## 3-Chloropyridin-2-amine

Zhi-Nan Hu, ${ }^{\text {a }}$ Hui-Bin Yang, ${ }^{\text {b }}$ Huan Luo ${ }^{\text {b }}$ and Bin Li ${ }^{\text {b }}$ *<br>${ }^{\text {a }}$ Department of Chemistry, Liaoning University, Shenyang 110036, People's Republic of China, and ${ }^{\mathbf{b}}$ Agrochemicals Division, Shenyang Research Institute of Chemical Industry, Shenyang 110021, People's Republic of China<br>Correspondence e-mail: libin1@sinochem.com

Received 2 April 2011; accepted 11 April 2011
Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.059 ; w R$ factor $=0.182 ;$ data-to-parameter ratio $=14.5$.

In the title compound, $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{ClN}_{2}$, a by-product in the synthesis of ethyl 2-(3-chloropyridin-2-yl)-5-oxopyrazolidine-3-carboxylate, the amine groups form intermolecular hydrogen-bonding associations with pyridine N -atom acceptors, giving centrosymmetric cyclic dimers. Short intermolecular $\mathrm{Cl} \cdots \mathrm{Cl}$ interactions [3.278 (3) $\AA$ ] also occur.

## Related literature

The title compound was isolated as a by-product in the preparation of ethyl 2-(3-chloropyridin-2-yl)-5-oxopyr-azolidine-3-carboxylate, an intermediate in the synthesis of the insecticide chlorantraniliprole (systematic name 3-bromoN -[4-chloro-2-methyl-6-[(methylamino)carbonyl]phenyl]-1-(3-chloro-2-pyridinyl)-1 $H$-pyrazole-5-carboxamide), see: Lahm et al. (2005). For related structures, see: Chao et al. (1975); Anagnostis \& Turnbull (1998); Hemamalini \& Fun (2010).

## 3-Chloropyridin-2-amine

## Zhi-Nan Hu, Hui-Bin Yang, Huan Luo and Bin Li

## S1. Comment

The structures of salts of the halo-substituted aminopyridine, such as 2-amino-5-chloropyridine-fumaric acid (Hemamalini \& Fun, 2010), 2-amino-3,5-dichloropyridinium chloride monohydrate (Anagnostis \& Turnbull, 1998), are known but the the structure of 2-amino-3-chloropyridine is not known. This compound, $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{Cl}_{1} \mathrm{~N}_{2}$ (I) was isolated as a by-product in the preparation of ethyl 2-(3-chloropyridin-2-yl)-5-oxopyrazolidine-3-carboxylate, an important intermediate in the synthesis of the insecticide chlorantraniliprole (3-bromo-N-[4-chloro-2-methyl-6-[(methylamino) carbonyl]phenyl]-1-(3-chloro-2-pyridinyl)-1H-pyrazole-5-carboxamide) (Lahm et al., 2005). In the structure of (I) (Fig. 1), intermolecular amine $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}_{\text {pyridine }}$ hydrogen-bonding interactions (Table 1) give centrosymmetric cyclic dimers (Fig. 2), similar to those found in the structure of 2-aminopyridine (Chao et al., 1975). In (I) there is an intramolecular N $-\mathrm{H} \cdots \mathrm{Cl}$ interaction [3.001 (3) $\AA$ ] while in the crystal structure there are also short $\mathrm{Cl} \cdots \mathrm{Cl}{ }^{\mathrm{ii}}$ interactions [3.278 (3) $\AA$ ] [symmetry code: (ii) $-x+2,-y,-z+1$ ].

## S2. Experimental

Sodium ethoxide $(3.48 \mathrm{~g}, 50.4 \mathrm{mmol})$ and 150 ml of absolute ethanol was heated to reflux, after wich $6.80 \mathrm{~g}(47.4 \mathrm{mmol})$ of 3-chloro-2-hydrazinylpyridine was added and the mixture was allowed to reflux for 5 minutes. The slurry was then treated dropwise with $9.79 \mathrm{~g}(56.9 \mathrm{mmol})$ of diethyl maleate over a period of 5 minutes and the resulting solution was held at reflux for 10 minutes. After cooling to 338 K , the reaction mixture was treated with $5.0 \mathrm{ml}(87.3 \mathrm{mmol})$ of glacial acetic acid. The mixture was diluted with 60 ml water and then cooled to room temperature, giving a precipitate which was isolated via filtration, and separated by column chromatography on silica gel (eluent: ethyl acetate/petroleum ether, 1:5). The title compound was obtained as a yellow solid ( $0.60 \mathrm{~g}, 8 \%$ ) and recyrstallized from dichloromethane to afford colorless single crystals suitable for X-ray diffraction. Anal.: Calc. for $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{Cl}_{1} \mathrm{~N}_{2}$ : C, 46.47; H, 3.84; Cl, 27.96; N, $21.85 \%$. Found: C, $46.71 ; \mathrm{H}, 3.99 ; \mathrm{Cl}, 27.58 ; \mathrm{N}, 21.79 .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right): 5.02\left(\mathrm{~s}, 2 H, \mathrm{NH}_{2}\right), 6.62(\mathrm{dd}, 1 H$, pyridine-H), $7.48(\mathrm{dd}, 1 H$, pyridine-H), $7.98(\mathrm{dd}, 1 H$, pyridine-H).

## S3. Refinement

Although all H atoms were visible in difference maps, they were placed in geometrically calculated positions, with $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}-\mathrm{H}=\mathrm{o} .86$ and $0.93 \AA$ respectively, and included in the final refinement in the riding model approximation, with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

0 restraints
Primary atom site location: structure-invariant direct methods

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
