## **Chloridobis(2-chlorobenzyl)(quinolin-8-olato- $\kappa^2N,O$ )tin(IV)**

**Thy Chun Keng, Kong Mun Lo and Seik Weng Ng**

### **S1. Comment**

8-Hydroxyquinoline forms a large number of derivatives with organotin systems; when the reaction is carried out with diorganotin dichlorides, in some cases only one chloride is displaced whereas in other cases both are displaced. No base is added to abstract the acid hydroxy proton. In the present study, the reaction of 8-hydroxyquinoline with bis(2-chlorobenzyl)tin dichloride affords  $\text{SnCl}(\text{C}_7\text{H}_6\text{Cl})_2(\text{C}_9\text{H}_6\text{NO})$  (Scheme I). The  $\text{Sn}^{\text{IV}}$  atom in the three independent molecules  $N,O$ -chelated by the quinolinato group and it exists in a *cis*- $\text{C}_2\text{SnNOCl}$  trigonal bipyramidal geometry; the O atom lies in the equatorial plane and the Cl and N atoms comprise the axial sites (Figs. 1, 2, 3). The molecules are positioned such that two are disposed about a false-center of inversion (Fig. 2). There are no  $\text{Sn}\cdots\text{Cl}$  contacts and the distortion of geometry from the idealized trigonal bipyramid is minimal (14.7% in the first molecule, 13.7% in the second and only 9.9% in the third).

In the diethytin derivative, an intermolecule  $\text{Sn}\cdots\text{Cl}$  interaction raises the coordination number of Sn to six in the chain structure (Shi & Hu, 1987). On the other hand, the methylphenyltin derivative also has Sn in a six-coordinate environment, but the higher coordination number arises from bridging by the quinolinate ion that results in a dinuclear molecule (Vafaei *et al.*, 2010).

### **S2. Experimental**

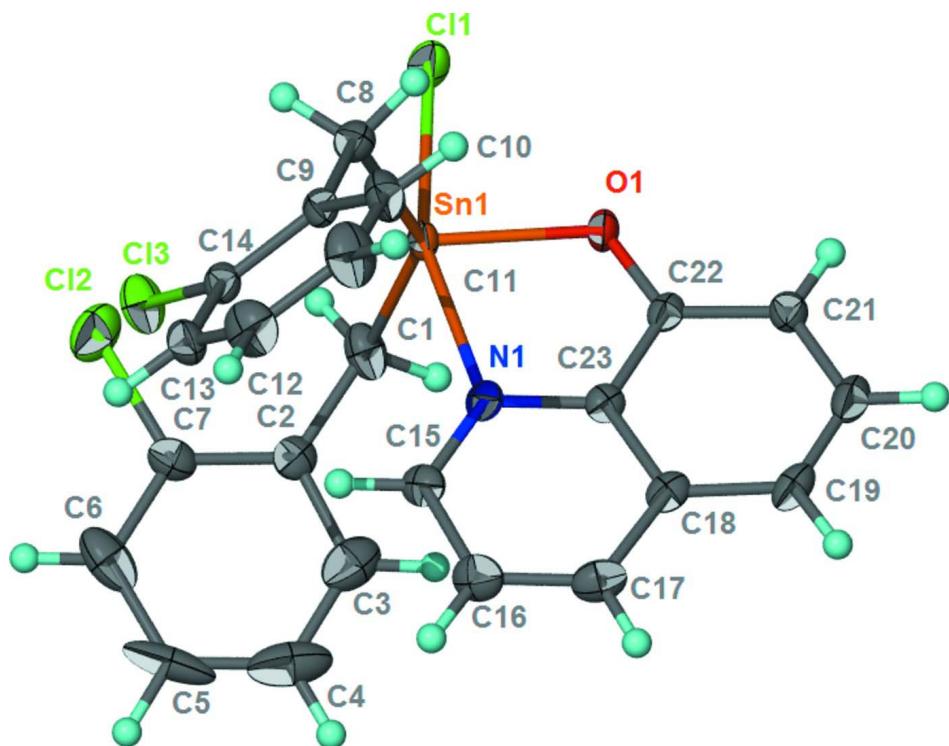

The diorganotin dichloride was synthesized by the direct reaction of 2-chlorobenzyl chloride and metallic tin according to a literature procedure (Sisido *et al.*, 1961). The diorganotin dichloride (0.44 g, 1 mmol) and 8-hydroxyquinoline (0.15 g, 1 mmol) were dissolved in chloroform (50 ml) to give a yellow solution. The solution was filtered and the solvent allowed to evaporate to yield yellow crystals.

### **S3. Refinement**

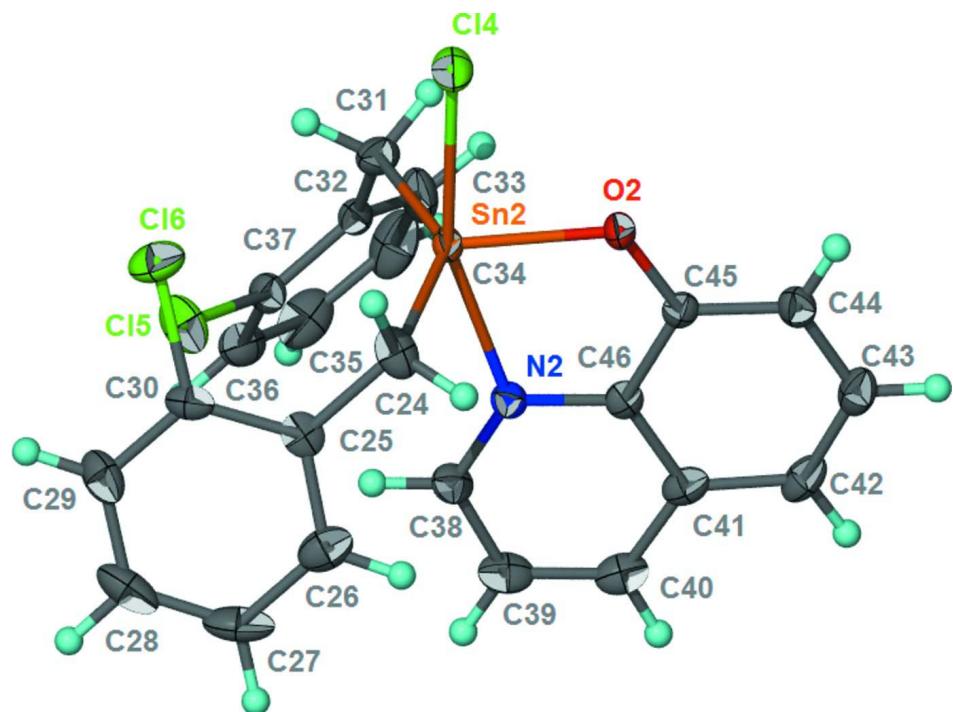

H-atoms were placed in calculated positions ( $\text{C}-\text{H}$  0.95 to 0.99 Å) and were included in the refinement in the riding model approximation, with  $U(\text{H})$  set to 1.2 times  $U_{\text{eq}}(\text{C})$ .

The final difference Fourier map had a peak in the vicinity of Sn1 as well as a hole in the vicinity of the same atom.

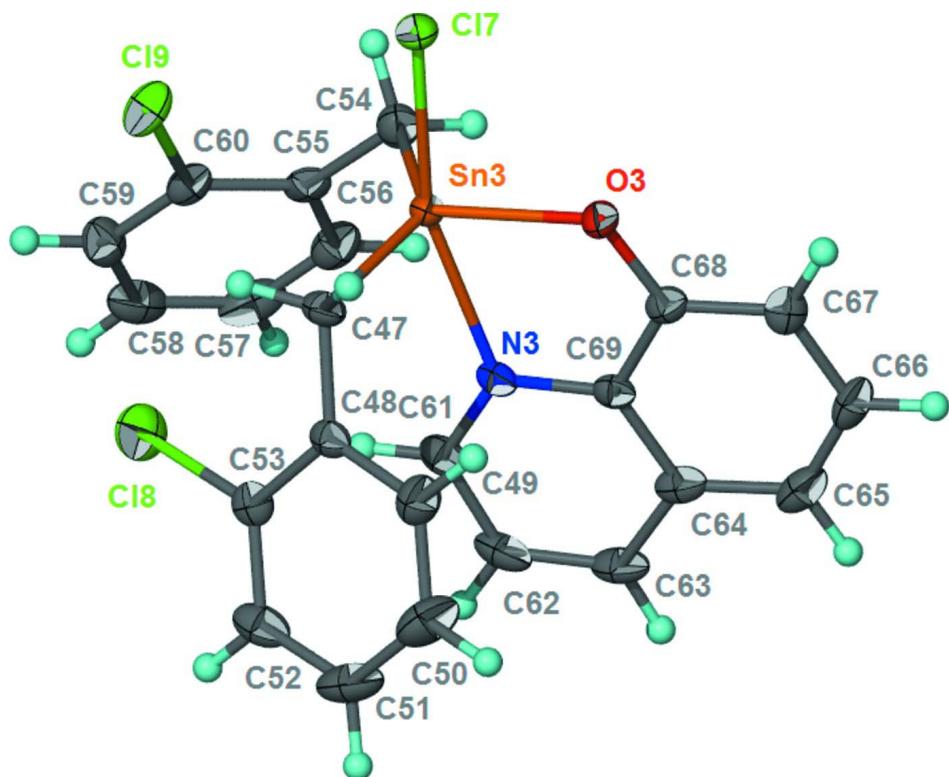

The second parameter of the weighting scheme is rather large; however, as lowering this number to less than 10 had only a minor effect on the refinement with regard to the peak/hole. This high value was retained.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
