Received 25 April 2011; accepted 2 June 2011

Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.039 ; w R$ factor $=0.130$; data-to-parameter ratio $=16.6$.

The title compound, $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{O}_{6}$, was obtained by the reaction of ethyl 4-hydroxybenzoate with 1,2-dichloroethane in dimethylformamide. The molecule lies around the crystallographic inversion center at $(0,0,0)$, with the asymmetric unit consisting of one half of the molecule. The two ethyl groups are in trans positions. The ethyl, carboxyl, aryl and $\mathrm{O}-\mathrm{CH}_{2}$ groups are coplanar with an r.m.s. deviation of 0.0208 (9) A. The whole molecule is planar with an r.m.s. deviation of 0.0238 (9) $\AA$ for the 19 atoms used in the calculation and 0.0071 (9) $\AA$ for the two aryl groups in the molecule. A weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond and a $\mathrm{C}-\mathrm{H} \cdots \pi$ interaction help to consolidate the three-dimensional network.

## Zhen Ma and Huang Yang

## S1. Comment

There has been, in recent years, a considerable interest in the study of esters (Hou \& Kan, 2007; Tashiro et al., 1990; Zhang et al., 2007), since these compounds are commodity chemicals used as intermediates in the manufacture of acids and to produce many important industrial products. Hence, our current work aims to prepare esters to produce acids and investigate their coordination behaviors with metal ions and study their applications in many fields (Chen \& Liu, 2002). Herein, we report a new diester which was obtained by reaction of ethyl 4-hydroxybenzoate with 1,2-dichloroethane in DMF and its structure was confirmed by elemental analysis, IR, NMR spectra and X-ray crystal analysis.

The structure consists of a neutral molecular unit (Fig. 1).The molecule lies on a crystallographic inversion center at ( 0 , 0,0 ), thus leading to one half of the molecule being present per asymmetric unit. All bond lengths and angles are within normal ranges (Allen et al., 1987). The ethyl, aryl, carboxyl and the $\mathrm{O}-\mathrm{CH}_{2}$ groups of one half molecule are coplanar to form one plane with an r.m.s. deviation of 0.0208 (9) $\AA$. By symmetry, the whole molecule is coplanar with an r.m.s deviation of 0.0238 (9) $\AA$ for 19 atoms being used for calculation and 0.0071 (9) $\AA$ for the two aryl groups at the molecule. Because of the symmetry of the inversion center, the two ethyl groups at the molecule are in a trans position. One weak hydrogen bond between one hydrogen atom and the oxygen atom of a neighboring molecule is present in the structure: H6A on C 6 and $\mathrm{O} 2{ }^{\text {ii }}$ [symmetry code: (ii) $x,-y+1 / 2, z-1 / 2$ ] (Table 1). The molecules display intermolecular $\mathrm{C}-$ $\mathrm{H} \cdots \pi$ interactions between a $-\mathrm{CH}_{2}-(\mathrm{C} 10)$ and a neighboring aryl group $[\mathrm{H} . . \mathrm{Cg} 2.647 \AA, \mathrm{Cg}$ is the centroid of the six membered ring of $\mathrm{C} 4{ }^{\text {iii }}-\mathrm{C} 9{ }^{\text {iii }}$, symmetry code: (iii) $\left.x+1, y, z\right]$.

## S2. Experimental

The title compound was obtained by the reaction of ethyl 4-hydroxybenzoate with 1,2-dichloroethane in $N, N^{\prime}$-dimethylformamide (DMF) according to a reported procedure (Ma \& Liu, 2002; Ma \& Cao, 2011). In a $100 \mathrm{~cm}^{3}$ flask fitted with a funnel, ethyl 4-hydroxybenzoate ( $8.3 \mathrm{~g}, 50 \mathrm{mM}$ ) and potassium carbonate were mixed in $50 \mathrm{~cm}^{3}$ of DMF. To this solution was added dropwise a stoichiometric quantity of 1,2-dichloroethane ( $2.5 \mathrm{~g}, 25 \mathrm{mM}$ ) dissolved in $20 \mathrm{~cm}^{3}$ of DMF for a period of an hour with stirring. The mixture was then stirred for 24 h at 353 K . The solution was concentrated under reduced pressure and the white solid formed by adding a large quantity of water ( $200 \mathrm{~cm}^{3}$ ) was filtered off and recrystallized from ethanol and decolored with activated carbon. A colorless solid was obtained (yield $30 \%$, m.p: 388390 K ). Slow evaporation of a solution of the title compound in ethanol and dichloromethane (1:1) led to the formation of colorless crystals, which were suitable for X-ray characterization. Anal. Calcd. for [ $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{O}_{6}$ ] (\%): C, 67.03; $\mathrm{H}, 6.19$; found: $\mathrm{C}, 66.75$; $\mathrm{H}, 6.46$; $\operatorname{IR}(\mathrm{KBr})$, $\left(\mathrm{cm}^{-1}\right)$ : 1711, $(\mathrm{C}=\mathrm{O}), 1605,1509,1477\left(\mathrm{C}=\mathrm{C}\right.$ of aryl), 1280, 1252, 1165, $1105\left(\mathrm{CH}_{2}-\right.$ $\left.\mathrm{O}-\mathrm{CH}_{2}\right), 1045,1027,870-715,(\mathrm{Ar}-\mathrm{H}) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right): 7.97(\mathrm{~d}, 4 \mathrm{H}, J=8.8 \mathrm{~Hz}, \operatorname{aryl}, \mathrm{c}), 6.94(\mathrm{~d}, 4 \mathrm{H}, J=8.8 \mathrm{~Hz}$, aryl, d), $4.34\left(\mathrm{~d}, 4 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{CH}_{2}, \mathrm{f}\right), 4.31\left(\mathrm{~d}, 4 \mathrm{H}, \mathrm{COOCH}_{2}, \mathrm{~g}\right), 1.35\left(\mathrm{t}, 6 \mathrm{H},-\mathrm{CH}_{3}, \mathrm{~h}\right) .{ }^{13} \mathrm{C}$ NMR: $166.4(-\mathrm{COO}, \mathrm{a}), 162.4$ (aryl, b), 131.8 (aryl, c), 123.7 (aryl, e), 114.4 (aryl, d), $66.6\left(\mathrm{CH}_{2} \mathrm{CH}_{2}, \mathrm{f}\right), 60.9\left(\mathrm{CH}_{2} \mathrm{CH}_{2}, \mathrm{~g}\right), 14.6\left(-\mathrm{CH}_{3}\right.$, h). (see Figure 3 for the NMR atom number assignment).

## S3. Refinement

All H atoms were positioned geometrically and refined using a riding model with $\mathrm{C}-\mathrm{H}=0.93-0.97 \AA$ and with $U_{\text {iso }}(\mathrm{H})$ $=1.2$ times $U_{\mathrm{eq}}(\mathrm{C})$.

Figure 1
The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level. H atoms are presented as small spheres of arbitrary radius. [Symmetry code: (i) $-x,-y,-z$ ]

Figure 2
A view of the crystal packing along the $a$ axis. The thin dashed lines are used to show the hydrogen bonds. The thick dashed line is used to show the intermolecular $\mathrm{CH}-\pi$ interactions of $-\mathrm{CH}_{2}-(\mathrm{C} 6)$ and the neighboring aryl groups, from their H atoms to the centroids of the rings of the aryl groups.

## Figure 3

An additional scheme with the numbering scheme used for the NMR spectra.

## Special details

Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving 1.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor wR and goodness of fit S are based on $\mathrm{F}^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $\mathrm{F}^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.

Symmetry code: (i) $-x,-y,-z$.
Hydrogen-bond geometry ( $A,{ }^{\circ}$ )
Cg is the centroid of the $\mathrm{C} 4-\mathrm{C} 9$ ring.
