Received 15 June 2011; accepted 17 June 2011
Key indicators: single-crystal X-ray study; $T=120 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.017 ; w R$ factor $=0.048$; data-to-parameter ratio $=14.9$.

The title compound, $\mathrm{C}_{11} \mathrm{H}_{17} \mathrm{Br}$, has crystallographically imposed mirror symmetry in the solid state with molecules bisected by mirror planes parallel to the crystallographic ac plane (five C atoms, three H atoms and the Br atom lie on the mirror plane). The asymmetric unit contains one halfmolecule. The crystal packing is stabilized only via weak non-specific van der Waals interactions.

## 1-(Bromomethyl)adamantane <br> Jarmila Černochová, Andrea Čablová, Michal Rouchal, Marek Nečas and Robert Vícha

## S1. Comment

The title compound is well known and widely used in chemistry of adamantane derivates as convenient source of 1adamantylmethyl substituent (Nordlander et al., 1966). Although this compound is very easy to purify via crystallization or sublimation, it is prone to form soft thin plates. Due to this fact hand in hand with relatively low melting point (314316 K ), the crystal structure was not published yet. We successfully prepared sufficiently thick plates usable for XRD analyses via very slow partial evaporation of solvents from the solution of the title compound in DMF, petroleum ether, and ethyl acetate at room temperature. The molecule of the title compound contains the adamantane moiety consisting from three fused cyclohexane rings in classical chair conformation. The value of $\mathrm{C}-\mathrm{C}-\mathrm{C}$ angles varies within the range of $108.35(6)-110.27(12)^{\circ}$. No specific interactions, in addition to the van der Waals interactions, were observed to stabilize the packing of the molecules in the crystal.

## S2. Experimental

The title compound was prepared according to slightly modified previously published procedure (Nordlander et al., 1966). The mixture of starting 1-adamantylmethanol ( $23.3 \mathrm{~g}, 0.14 \mathrm{~mol}$ ), $\mathrm{ZnBr}_{2}(80.7 \mathrm{~g}, 0.36 \mathrm{~mol})$, and azeotropic hydrobromic acid ( $412 \mathrm{~cm}^{3}$ ) was refluxed until the GC analyses showed complete disappearing of starting alcohol. Mixture was extracted with hexane:diethyl ether ( $1: 1, \mathrm{v}: \mathrm{v}$ ), collected organic portions were successively washed with $10 \%$ sodium bicarbonate solution and brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The evaporation of solvent yielded of $26.5 \mathrm{~g}(83 \%)$ of pale yellow soft plates.

Figure 1
Molecular structure of of the title compound with atoms represented as $50 \%$ probability ellipsoids. Symmetry code used to generate the complete molecule: $x,-y, z$.

## Figure 2

The unit cell viewed along the $a$-axis. H-atoms have been omitted for clarity.

$\Delta \rho_{\text {min }}=-0.29$ e $\AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
