S1. Comment

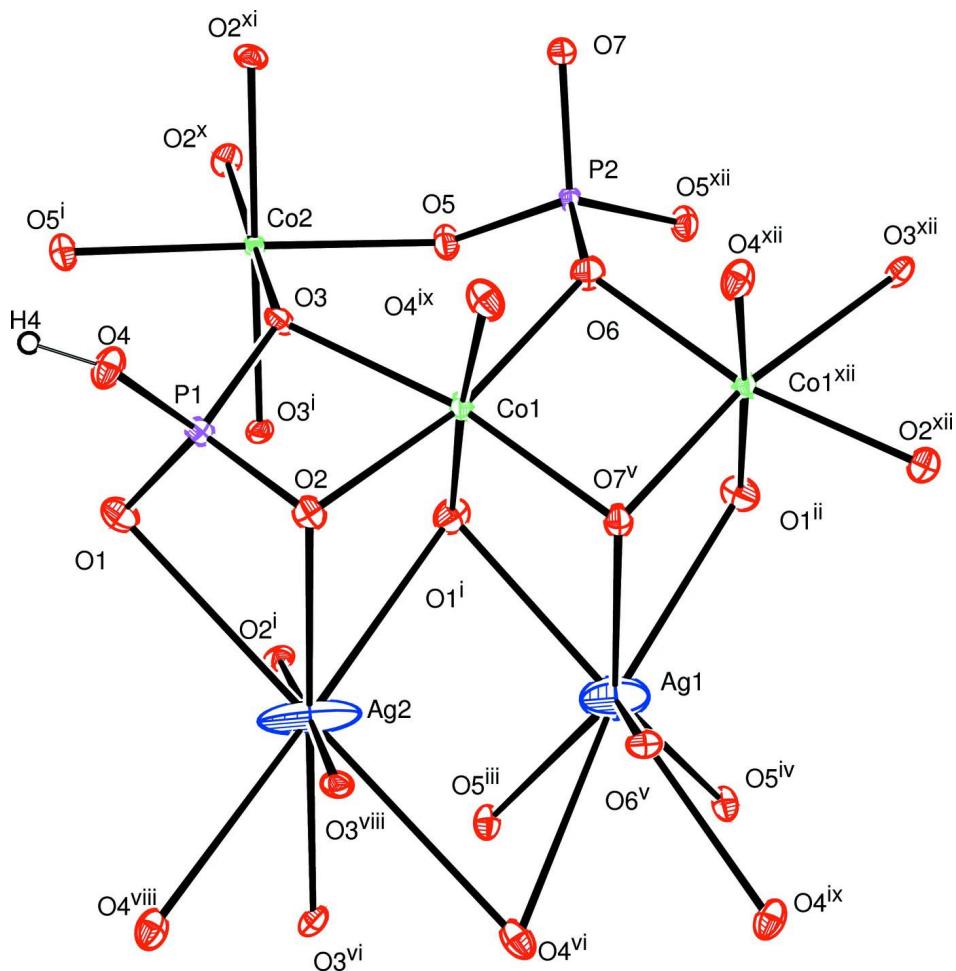

Compounds prepared hydrothermally in the $\text{Ag}_2\text{O}-\text{MO}-\text{P}_2\text{O}_5$ (M = divalent cation) systems include $\text{AgMg}_3(\text{PO}_4)(\text{HPO}_4)_2$ (Assani *et al.*, 2011a), $\text{AgMn}_3(\text{PO}_4)(\text{HPO}_4)_2$ (Leroux *et al.*, 1995), $\text{AgCo}_3(\text{PO}_4)(\text{HPO}_4)_2$ (Guesmi & Driss, 2002), $\text{AgNi}_3(\text{PO}_4)(\text{HPO}_4)_2$ (Ben Smail & Jouini, 2002), $\text{Ag}_2\text{Ni}_3(\text{HPO}_4)(\text{PO}_4)_2$ (Assani *et al.*, 2011b), and $\gamma\text{-AgZnPO}_4$ (Assani *et al.*, 2010). $\text{Ag}_2\text{Co}_3(\text{HPO}_4)(\text{PO}_4)_2$, isostructural to the Ni analogue, contains CoO_6 octahedra and PO_4 and $\text{PO}_3(\text{OH})$ tetrahedra which share corners and edges to form a three-dimensional framework (Fig. 1). Two types of tunnels aligned parallel to the *a*-direction accommodate Ag^+ cations (Fig. 2).

S2. Experimental

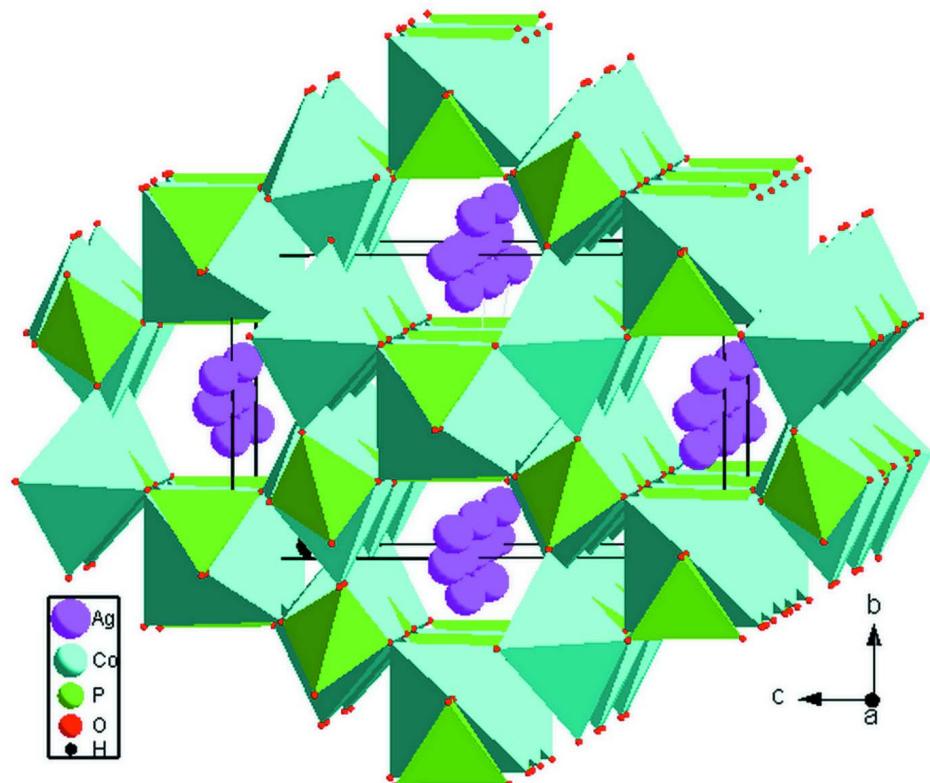

A mixture of 0.0849 g AgNO_3 , 0.0529 g $\text{CoCO}_3\cdot\text{Co}(\text{OH})_2$, 10 mL of 85 wt.% H_3PO_4 , and 10 mL of distilled water was placed in a 23-mL Teflon-lined autoclave, which was heated at 468 K under autogeneous pressure for two days. Pink crystals of the title compound were obtained after the product was filtered, washed with deionized water, and dried in air.

S3. Refinement

The O-bound H atom was initially located in a difference map and refined with O—H distance restraints of 0.86 (1) in a riding model approximation with $U_{\text{iso}}(\text{H})$ set to $1.2U_{\text{eq}}(\text{O})$. The highest and deepest hole in the final difference Fourier map are located at 0.70 Å and 0.51 Å, respectively, from Ag1.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against all reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on all data will be even larger.
