Received 22 May 2011; accepted 16 June 2011
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.001 \AA$; $R$ factor $=0.040 ; w R$ factor $=0.105$; data-to-parameter ratio $=30.7$.

In the title compound, $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{2}$, the cyclohexane ring adopts a chair conformation. he crystal structure of the previously reported monoclinic modification have intramolecular $\mathrm{CN} \cdots \mathrm{CN}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ interactions. These types of interaction are not present in this new modification whose crystal structure is built up by van der Waals interactions.

# Second monoclinic modification of cyclohexane-1,1-dicarbonitrile 

Nurlana D. Sadikhova, Ali. N. Khalilov, Atash V. Gurbanov and Iván Brito

## S1. Comment

Fig. 1 shows the structure of title compound, (I), which is a positional isomer of a previously reported by (Echeverria et al., 1995), (II). The bond distances and the six C-C-C bond angles in (I) are slightly longer than (II). The crystal structure of (II) have intermolecular $\mathrm{CN} \cdots \mathrm{CN}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ interactions, whereas this kind of interactions are not present in (I). The values of the ring puckering parameters: $\mathrm{Q}_{\mathrm{T}}=0.5665 \AA, \theta=0.72^{\circ}$ and $\varphi=107.4^{\circ}$ (Cremer \& Pople, 1975), indicate that the cyclohexane has a chair conformation. The $\mathrm{C} 1-\mathrm{C} 2$ and $\mathrm{C} 1-\mathrm{C} 6$ bond distances are more longer than the other $\mathrm{C}-\mathrm{C}$ distances in the cyclohexyl ring. The lengthening of these bonds with increasing ring size may be attributed to steric crowding about C 1 atom. The cyano groups are essentially collinear with C 1 and the $\mathrm{N}-\mathrm{C}-\mathrm{C} 1$ angles is $178.55(10)^{\circ}(\mathrm{mean})$. A $\sigma_{\mathrm{h}}$ plane passing through the CN groups and the C 1 atom which bisects the cyclohexyl ring.

## S2. Experimental

A mixture of malonodinitrile ( $0.1 \mathrm{~mol}, 6.6 \mathrm{~g}$ ), 23 gr 1,5-dibromopentane ( $0.1 \mathrm{~mol}, 23 \mathrm{~g}$ ) and $46 \mathrm{gr} \mathrm{K}_{2} \mathrm{CO}_{3}$ in dry DMSO $(50 \mathrm{ml})$, was stirred for 12 h at $70^{\circ} \mathrm{C}$. After cooling down, the reaction mixture was poured into water and extracted with ether. The organic layer was washed several times with water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent evaporated. The crude product was purified by vacuum distillation yielding $10.5 \mathrm{gr}(87 \%)$ of a solid compound which after recrystallization in hexane gave white crystals: $\mathrm{mp} 65^{\circ} \mathrm{C} . ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCI}_{3}\right) \delta 1.52\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.72\left(\mathrm{~m}, 4 \mathrm{H}, 2 \mathrm{CH}_{2}\right), 2.12(\mathrm{t}$, $4 \mathrm{H}, 2 \mathrm{CH}_{2}$ ); ${ }^{13} \mathrm{CNMR}^{2}\left(75 \mathrm{MHz}, \mathrm{CDCI}_{3}\right) \delta 22.3,23.8,34.7,41.2,117.3$. Analysis, found, \%: C: 71.42, H: 7.78, N: 20.63 $\left(\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{2}\right)$; calculated, \%: C: 71.61, H: 7.51, $\mathrm{N}: 20.88$

## S3. Refinement

One reflection ( -713 ) was omitted of the refinement due to to bad agreement between observed and calculated factors. All H-atoms were placed in calculated positions $\left[\mathrm{C}-\mathrm{H}=0.99 \AA, U_{\text {iso }}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})\right]$ and were included in the refinement in the riding model approximation.

## Figure 1

The structure of (I), showing the atom-numbering scheme. Displacement ellipsoids are plotted at the $30 \%$ probability level.

> $w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0492 P)^{2}+0.1357 P\right]$
> $\quad$ where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
> $(\Delta / \sigma)_{\max }<0.001$
> $\Delta \rho_{\max }=0.31$ e $\AA^{-3}$
> $\Delta \rho_{\min }=-0.21$ e $\AA^{-3}$

## Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
