Received 15 June 2011; accepted 17 June 2011

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.067 ; w R$ factor $=0.180 ;$ data-to-parameter ratio $=24.2$.

The asymmetric unit of the title compound, $\mathrm{C}_{5} \mathrm{H}_{2} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{O}_{2}$, consists of two crystallographically independent molecules. The pyridine ring in each molecule is essentially planar, with maximum deviations of 0.004 (4) and $0.007(4) \AA$. Short $\mathrm{Cl} \cdots \mathrm{O}[3.09(3)$ and $3.13(4) \AA$ ] and $\mathrm{Cl} \cdots \mathrm{Cl}[3.38(12) \AA$ ] contacts were observed. No significant intermolecular interactions were observed in the crystal packing.

## 2,6-Dichloro-3-nitropyridine

Hoong-Kun Fun, Suhana Arshad, B. Chandrakantha, Arun M. Isloor and Prakash Shetty

## S1. Comment

Nitropyridine nucleus played a pivotal role in the development of different medicinal agents and in the field of agrochemicals (Davis et al., 1996). It is seen from the current literature that pyridine derivatives have been developed and used as insecticidal agents (Vacher et al., 1998). Nitrated pyridines and their derivatives are important intermediates in synthesis of heterocyclic compounds in dyes and pharmaceutical products (Olah et al., 1980). Fused heterocycles containing nitropyridine systems have been associated with several biological and medicinal activities including antiolytic (Olah et al., 1980), antiviral and anti-inflammatory (Bare et al., 1989) profiles.
The asymmetric unit of the tittle compound (Fig. 1), consists of two crystallographically independent molecules $A$ and $B$. The pyridine rings ( $\mathrm{N} 1 / \mathrm{C} 1-\mathrm{C} 5$ ) for molecules $A$ and $B$ are essentially planar with maximum deviations of 0.004 (4) $\AA$ at atom C1A and 0.007 (4) $\AA$ at atom C3B, respectively. The bond lengths (Allen et al., 1987) and angles are within normal ranges. In addition, short $\mathrm{Cl} \cdots \mathrm{O}[\mathrm{Cl1A} \cdots \mathrm{O} 2 \mathrm{~A}(1-x,-1 / 2+y, 1 / 2-z)=3.093$ (3) $\AA$ and $\mathrm{Cl} 2 \mathrm{~A} \cdots \mathrm{O} 2 \mathrm{~A}(1-x, 2-y$, $z)=3.132(4) \AA]$ and $\mathrm{Cl} \cdots \mathrm{Cl}[\mathrm{Cl} 2 \mathrm{~A} \cdots \mathrm{Cl} 2 \mathrm{~A}(1-x, 2-y,-z)=3.3839(12) \AA]$ contacts were observed.
The crystal packing is shown in Fig. 2. No significant intermolecular interactions were observed in the crystal packing.

## S2. Experimental

2,6-Dichloropyridine ( $5 \mathrm{~g}, 0.033 \mathrm{~mol}$ ) was added lotwise to mixture of concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(25 \mathrm{ml})$ and fuming nitric acid $(10 \mathrm{ml})$ at $0{ }^{\circ} \mathrm{C}$. After the addition, the reaction mixture was heated to $65^{\circ} \mathrm{C}$ for 2 h . After completion of the reaction, the reaction mixture was cooled to room temperature and quenched with ice water. The solid that separated out was filtered and dried under vacuum. The crude product was purified by column chromatography using silica gel 60-120 mesh size and petroleum ether: ethyl acetate as eluent to afford title compound as a pale yellow solid. Yield: $3.0 \mathrm{~g}, 46.0 \%$. M.p.: 333-338 K (Johnson et al., 1967).

## S3. Refinement

All H atoms were positioned geometrically $[\mathrm{C}-\mathrm{H}=0.93 \AA]$ and refined using a riding model with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$. There is no pseudo-symmetry in the crystal structure.

Figure 1
The molecular structure of the title compound, showing the two independent molecules with atom labels and $30 \%$ probability displacement ellipsoids.

Figure 2
The crystal packing of the title compound.

$\Delta \rho_{\min }=-0.42$ e $\AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
