Received 2 June 2011; accepted 4 June 2011

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.034 ; w R$ factor $=0.105$; data-to-parameter ratio $=13.2$.

The cation of the title salt, $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{NO}_{4}{ }^{+} \mathrm{F}^{-}$, lies on a twofold rotation axis that passes through the N and $4-\mathrm{C}$ atoms of the pyridine ring; the carboxylic acid substituent features unambiguous carbon-oxygen single and double bonds. The fluoride ion is a hydrogen-bond acceptor to two hydroxy and one amino groups, these $\mathrm{O}-\mathrm{H} \cdots \mathrm{F}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{F}$ hydrogen bonds leading to the formation of a layer structure parallel to the $a b$ plane. The F atom lies on a position of 2 site symmetry.

## 3,5-Dicarboxypyridinium fluoride

## Seik Weng Ng and Yi-Ping Tong

## S1. Comment

The organic salt was the crystalline product obtained in a hydrothermal reaction involving molybdic acid, hydrogen fluoride and pyridine-3,5-dicarboxylic acid; the reaction merely involved the protonation of the carboxylic acid by hydrogen fluoride. The parent carboxylic acid itself displays short $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Cowan et al., 2005; Takusagawa et al., 1973). The hydrogen fluoride salt, $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{NO}_{4}{ }^{+} \mathrm{F}^{-}$(Scheme I, Fig. 1), lies on a twofold rotation axis that passes through the pyridine ring; the carboxylic acid substituent features unambiguous carbon-oxygen single- and doublebonds [1.306 (1), 1.207 (1) $\AA$ ]. The fluoride ion is hydrogen bond acceptor to two hydroxy and one amino groups, these $\mathrm{O}-\mathrm{H} \cdots \mathrm{F}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{F}$ hydrogen bonds leading to the formation of a layer structure parallel to the $a-b$ plane (Fig. 2).

## S2. Experimental

To a solution of molybdic acid, $\mathrm{H}_{2} \mathrm{MoO}_{4}(1 \mathrm{mmol})$ in water $(10 \mathrm{ml})$ was added 3,5-pyridinedicarboxylic acid ( 5 mmol ). The mixture was placed in a 23 ml , Teflon-lined, stainless steel Parr bomb. Several drops of hydrofluoric acid were added. The bomb was heated at 373 for 3 days. It was then cooled to room temperature at 5 K per hour. Yellow blockshaped crystals were obtained in about $50 \%$ yield.

## S3. Refinement

Carbon-bound H -atoms were placed in calculated positions ( $\mathrm{C}-\mathrm{H} 0.93 \AA$ ) and were included in the refinement in the riding model approximation, with $U(\mathrm{H})$ set to $1.2 U(\mathrm{C})$.
The amino and hydroxy H -atoms were located in a difference Fourier map, and were refined with a distance restraint of $\mathrm{N}-\mathrm{H} 0.88 \pm 0.01$ and $\mathrm{O}-\mathrm{H} 0.84 \pm 0.01 \AA$; their temperature factors were freely refined.

Figure 1
Thermal ellipsoid plot (Barbour, 2001) of $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{NO}_{4}{ }^{+} \mathrm{F}^{-}$at the $50 \%$ probability level; hydrogen atoms are drawn as spheres of arbitrary radius. The unlabeled atoms are related to the labeled ones by $-x, y, 3 / 2-z$.
