## Ammonium $\mathrm{O}, \mathrm{O}^{\prime}$-diethyl dithiophosphate

## Andrzej Okuniewski and Barbara Becker*

Department of Inorganic Chemistry, Gdansk University of Technology, 11/12
Narutowicza Str., 80-233 Gdańsk, Poland
Correspondence e-mail: barbara.becker@pg.gda.pl

Received 10 June 2011; accepted 13 June 2011
Key indicators: single-crystal X-ray study; $T=120 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.035 ; w R$ factor $=0.085$; data-to-parameter ratio $=18.4$.

In the title compound, $\mathrm{NH}_{4}{ }^{+} \cdot\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}\right)_{2} \mathrm{PS}_{2}{ }^{-}$, the ammonium cation is connected by four charge-assisted $\mathrm{N}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds to four tetrahedral $O, O^{\prime}$-diethyl dithiophosphate anions, forming layers parallel to (100). The polar and non-polar constituents of the layers are stacked alternately along [100]. Interlacing of the external ethyl groups through van der Waals interactions combines these layers into a three-dimensional structure.

## Ammonium $\mathrm{O}, \mathrm{O}^{\prime}$-diethyl dithiophosphate

## Andrzej Okuniewski and Barbara Becker

## S1. Comment

Ammonium $O, O^{\prime}$-diethyl dithiophosphate is frequently used as a source of the $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}\right)_{2} \mathrm{PS}_{2}{ }^{-}$ligand in coordination chemistry (Cotero-Villegas et al., 2011) and in analytical chemistry for determination of various ions, eg. As (Pozebon et al., 1998), Pb (Maltez et al., 2008), Cd (Carletto et al., 2009), Hg (Wu et al., 2006).
There are at least 340 structures deposited in the Cambridge Structural Database (v5.32; Allen, 2008) containing the $O, O^{\prime}$-diethyl dithiophosphate moiety, but there are no crystal structure of simple ammonium, sodium or potassium salts reported. Among these structures one can find 328 complexes (including 204 of row 6 family metals, mainly molybdenum compounds), five compounds with complex cations, five simple organic or inorganic compounds and finally two salts of 1,10-diaza-18-crown-6 (Chekhlov, 2000; Chekhlov et al., 1991).
In the crystal structure of the title compound, the asymmetric unit consists of one ammonium cation and one tetrahedral $O, O^{\prime}$-diethyl dithiophosphate anion (Fig. 1). The P—S distances are 1.9720 (8) $\AA$ and 1.9753 (8) $\AA$. These values are slightly lower than the mean value of 1.9872 (25) $\AA$ calculated for the 340 compounds deposited in the CSD. Each ammonium cation is connected by four $\mathrm{N}-\mathrm{H} \cdots \mathrm{S}$ hydrogen bonds to four $O, O^{\prime}$-diethyl dithiophosphate anions. This way three structural ring motifs are formed: two of them are centrosymmetric $-\mathbf{R}^{2}{ }_{4}(8), \mathbf{R}_{4}^{4}(12)$, and one is not $-\mathbf{R}^{3}{ }_{4}(10)$ (Fig. 2.) Hydrogen bonding interactions are summarized in Tab. 1.

The connected ions form layers parallel to the (100) plane. Each layer has an hydrophilic interior, where heteroatoms and hydrogen bonds can be found, and an hydrophobic exterior formed by the ethyl groups (Fig. 3). These layers interact with each other by van der Waals forces forming a three-dimensional crystal structure.

## S2. Experimental

1 g of commercially available ammonium $O, O^{\prime}$-diethyl dithiophosphate was dissolved in 5 ml of acetone and left to evaporate slowly. After one week colourless crystals suitable for single-crystal X-ray diffraction analysis were collected.

## S3. Refinement

Hydrogen atoms were placed at the calculated positions $\left(d_{\mathrm{CH}}=0.98-0.99 \AA\right.$ ) and were treated as riding on their parent atoms, with $U(\mathrm{H})$ set to $1.2-1.5$ times $U_{\text {eq }}(\mathrm{C})$. The $\mathrm{N}-\mathrm{H}$ distances were restrained to 0.88 (1) $\AA$.

Figure 1
The molecular structure of $\mathrm{NH}_{4}^{+} .\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}\right)_{2} \mathrm{PS}_{2}^{-}$, with displacement ellipsoids drawn at the $50 \%$ probability level.

Figure 2
Hydrogen bond pattern found in the structure of $\mathrm{NH}_{4}{ }^{+} .\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}\right){ }_{2} \mathrm{PS}_{2}{ }^{-}$, with $\mathbf{R}^{2}{ }_{4}(8), \mathbf{R}_{4}^{4}(12)$ and $\mathbf{R}^{3}{ }_{4}(10)$ structural motifs depicted. Hydrogen bonds are marked with dashed lines.

Figure 3
Layers of $\mathrm{NH}_{4}{ }^{+} .\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{O}\right)_{2} \mathrm{PS}_{2}{ }^{-}$projected down [001] (a)) and [010] (b)). Hydrogen bonds are marked with dashed lines, with hydrogen atoms omitted for clarity.

\(\Delta \rho_{\text {min }}=-0.21 \mathrm{e}^{-3}\)
```

## Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
