# Poly[( $\mu_{5}$-2,6-dimethylpyridine-3,5dicarboxylato)zinc] 

Ming-Xing Zhang, ${ }^{\text {a }}$ ( Xin Chen ${ }^{\text {a }}$ and Yi Zhu ${ }^{\text {b }}$<br>${ }^{\text {a }}$ College of Chemistry, Chongqing Normal University, Chongqing 400047, People's Republic of China, and ${ }^{\mathbf{b}}$ College of Life Science, Chongqing Normal University, Chongqing 400047, People's Republic of China<br>Correspondence e-mail: zmx0102@hotmail.com

Received 18 June 2011; accepted 20 June 2011
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.023 ; w R$ factor $=0.067$; data-to-parameter ratio $=10.3$.

In the polymeric title complex, $\left[\mathrm{Zn}\left(\mathrm{C}_{9} \mathrm{H}_{7} \mathrm{NO}_{4}\right)\right]_{n}$, the $\mathrm{Zn}^{\text {II }}$ cation is located on a twofold rotation axis and is coordinated by five 2,6-dimethylpyridine-3,5-dicarboxylate (mpdc) anions in a distorted $\mathrm{ZnNO}_{4}$ trigonal-bipyramidal geometry. The mpdc anion is also located on the twofold rotation axis and bridges five $\mathrm{Zn}^{\mathrm{II}}$ cations, forming the three-dimensional polymeric complex. Weak $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions are present in the crystal structure.

## S1. Comment

Recently, research on metal-organic frameworks (MOFs) has become of increasing interest (Long \& Yaghi, 2009). However, it is still a great challenge to assemble a predicted structure because there are numerous influences that can play decisive roles on the structure and crystal packing. Fortunately, these uncertainties can be reduced by the use of well selected spacers that have the ability to aggregate metal ions into different secondary building units (Zhao et al., 2003). Herein we reports an interesting five-connected zeolite-like coordination polymer based on highly-substituted pyridinedicarboxylates.
The title compound is a three-dimensional framework built from Zn cations that are linked by mpdc anions. From this arrangement cavities are formed. Zn 1 is coordinated by four oxygen atoms from four different $\mathrm{CO}_{2}{ }^{-}$groups of mpdc ligands and one pyridyl nitrogen atom from another mpde ligand. The mpdc ligand bridges five different Zn atoms and favors the construction of the structure with zeolite-like topology. The topology of the title compound is identical with the reported $[\mathrm{Cd}(\mathrm{mpdc})]_{\mathrm{n}}$ (Huang et al., 2007), but the coordination sphere of cation, the binding mode of the carboxylate group and the synthesis condition are different.
The combination of the dramatic twists between two carboxylate groups in mpdc ligands results in the formation of the intersecting double-stranded helical chain comprised of $\left[\mathrm{Zn}\left(\mathrm{CO}_{2}\right)_{2}\right]_{\mathrm{n}}$ ( Zn atoms as nodes).

## S2. Experimental

All chemicals were of reagent grade and used as purchased without further purification. A mixture of $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ ( $450 \mathrm{mg}, 1.5 \mathrm{mmol}$ ), $\mathrm{H}_{2} \mathrm{mpdc}(97.5 \mathrm{mg}, 0.5 \mathrm{mmol}),(\mathrm{Et})_{3} \mathrm{~N} 0.07 \mathrm{~mL}$ and $\mathrm{H}_{2} \mathrm{O} 10 \mathrm{~mL}$ was sealed in a 25 ml stainless steel reactor with Teflon liner and directly heated to $180^{\circ} \mathrm{C}$ for 3 days, and then cooled to room temperature. The crystal samples were washed with methanol to give the title compound in about $35 \%$ yield (based on $\mathrm{H}_{2}$ mpdc ligand).

## S3. Refinement

Constraint instruction 'delu 0.001 Zn 1 O 1 ' was used in the refinement. All H atoms were placed in geometrically idealized positions $(\mathrm{C}-\mathrm{H}=0.93 \AA)$ and treated as riding on their parent atoms, with $\mathrm{U}_{\text {iso }}(\mathrm{H})=1.5 \mathrm{U}_{\text {eq }}(\mathrm{C})$ for methyl H atoms and $1.2 \mathrm{U}_{\mathrm{eq}}(\mathrm{C})$ for aromatic H atom.

Figure 1
The coordination environments of Zinc ions, showing $30 \%$ probability displacement ellipsoids and hydrogen atoms have been removed for clarity. Symmetry codes: (i) $-x,-y,-z+1$; (ii) $-x+1 / 2,-y+1 / 2,-z+1$; (iii) $-x, y,-z+1 / 2$; (iv) $x,-y, z-$ $1 / 2$; (v) $-x+1,+y,-z+3 / 2$.

Figure 2
The presentation of the 3-D zeolite-like architecture. Methyl groups and hydrogen atoms have been removed for clarity. Polyhedra represent the $\mathrm{ZnNO}_{4}$ groups.

71 parameters
1 restraint
Primary atom site location: structure-invariant direct methods

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
