Received 19 March 2011; accepted 20 June 2011

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.053 ; w R$ factor $=0.172 ;$ data-to-parameter ratio $=21.1$.

In the structure of the title compound, $\mathrm{C}_{10} \mathrm{H}_{14} \mathrm{NO}^{+} \cdot \mathrm{Cl}^{-}$, both H atoms bound to nitrogen are involved in $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen-bonding interactions. These interactions join the cations and anions into dimeric units (two cations and two anions) with $R_{4}^{2}(8)$ motifs lying about inversion centers.

## Related literature

For the screening of molecular salts with physicochemical properties, see: Tong \& Whitesell et al. (1998); Shanker (1994). Over $40 \%$ of commercially available salts are hydrochlorides (Gould et al., 1986), and this trend is reflected in the available set of salt structures included in the Cambridge Structural Database (Allen et al., 2002). For a closely related structure, see: Au \& Tafeenko (1986).

## N -Methyl-2-oxo-1-phenylpropan-1-aminium chloride

## Shi Juan Wang

## S1. Comment

The importance of molecular salts as solid forms in pharmaceutical formulations is well known. For a given active ingredient, the isolation and selection of a salt with the appropriate physicochemical properties involves significant screening activity and has been discussed at some length in the literature (Tong \& Whitesell et al., 1998; Shanker et al., 1994). It is apparent that over $40 \%$ of marketed salts are hydrochlorides (Gould et al., 1986), and this trend is reflected in the available set of salt structures provided by the Cambridge Structural Database (Allen et al., 2002). Here we report the synthesis and crystal structure of the title compound, $N$-methyl-2-oxo-1-phenylpropan-1-aminium chloride (Fig. 1).
The bond distances and angles in the structure of the title compound agree very well with the corresponding distances and angles reported for a closely related compound (Au \& Tafeenko et al., 1986). It is noteworthy that both H-atoms bonded to one nitrogen ( N 1 ) are involved in hydrogen bonding interactions of the type $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds, forming dimers lying about inversion centers according to $R_{2}{ }^{2}(4)$ motifs in graph set notation (Tab.1, Fig.2). Dipoledipole and van der Waals interactions are effective in the molecular packing.

## S2. Experimental

To a stirred solution of 1-(methylamino)-1-phenylpropan-2-one ( $2.445 \mathrm{~g}, 0.015 \mathrm{~mol}$ ) in 30 mL of dry THF, hydrochloric acid $(1.52 \mathrm{~g}, 0.015 \mathrm{~mol})$ was added at the room temperature. The precipitate was filtered and washed with a small amount of ethanol $95 \%$. Single crystals suitable for X-ray diffraction analysis were obtained from slow evaporation of a solution of the title compound in water at room temperature.

## S3. Refinement

The H -atoms bonded to the C -atom were positioned geometrically and refined using a riding model, with $\mathrm{C}-\mathrm{H}=0.93-$ $0.97 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$. The H -atoms bonded to the N -atom were located from a difference map and refined using a riding model.

$\Delta \rho_{\text {max }}=0.27$ e $\AA^{-3}$
$\Delta \rho_{\text {min }}=-0.20 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
