## [2-(4-Methylbenzoyl)phenyl](4-methylphenyl)methanone

P. Narayanan, ${ }^{\text {a }}$ K. Sethusankar, ${ }^{\text {a* }}$ Meganathan Nandakumar ${ }^{\text {b }}$ and Arasambattu K. Mohanakrishnan ${ }^{\text {b }}$<br>${ }^{\text {a }}$ Department of Physics, RKM Vivekananda College (Autonomous), Chennai 600 004, India, and ${ }^{\mathbf{b}}$ Department of Organic Chemistry, University of Madras, Guindy Campus, Chennai 600 025, India<br>Correspondence e-mail: ksethusankar@yahoo.co.in

Received 7 July 2011; accepted 18 July 2011
Key indicators: single-crystal X-ray study; $T=295 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.050 ; \omega R$ factor $=0.154$; data-to-parameter ratio $=19.4$.

The asymmetric unit of the title compound, $\mathrm{C}_{22} \mathrm{H}_{18} \mathrm{O}_{2}$, contains one half-molecule, the complete molecule being generated by the operation of a crystallographic twofold rotation axis. The carbonyl group and the two C atoms attached to it forms interplanar angles of 23.67 (7) ${ }^{\circ}$ with the methyl-substituted phenyl ring and 50.74 (8) ${ }^{\circ}$ with the central ring. In the crystal, molecules are linked into infinite chains along the $b$-axis direction by intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions, generating $R_{2}^{2}(10)$ graph-set motifs.

## [2-(4-Methylbenzoyl)phenyl](4-methylphenyl)methanone

P. Narayanan, K. Sethusankar, Meganathan Nandakumar and Arasambattu K. Mohanakrishnan

## S1. Comment

Diketones are popular in organic synthesis, for their applications in biology and medicine. They are known to exhibit antioxidants, antitumour and antibacterial activities (Bennett et al., 1999). They are also key intermediates in the preparation of various heterocyclic compounds (Sato et al., 2008).
The title compound $\mathrm{C}_{22} \mathrm{H}_{18} \mathrm{O}_{2}$, contains one half molecule in the asymmetric unit, the complete molecule being generated by twofold rotation, with direction [ $\left.\begin{array}{lll}0 & 1 & 0\end{array}\right]$, having symmetry code: (i) $-x+1, y,-z+3 / 2$. X-ray analysis confirms the molecular structure and atom connectivity of the compound as illustrated in (Fig. 1). The carbonyl group (C3/C4/C5/O1) forms an interplanar angle of 23.67 (7) ${ }^{\circ}$ with the phenyl ring ( $\mathrm{C} 5 / \mathrm{C} 6 / \mathrm{C} 7 / \mathrm{C} 8 / \mathrm{C} 9 / \mathrm{C} 10$ ). The deviation of atom O1 from the phenyl ring (C5/C6/C7/C8/C9/C10) is -0.4719 (19) $\AA$ (Nardelli, 1983). The title compound exhibits structural similarities with the already reported related structures (Muto et al., 2010; Khan et al., 2009).
The central phenyl ring $\left(\mathrm{C} 1 / \mathrm{C} 2 / \mathrm{C} 3 / \mathrm{C1}^{\mathrm{i}} / \mathrm{C}_{2}{ }^{\mathrm{i}} / \mathrm{C} 3^{\mathrm{i}}\right)$ forms dihedral angles of $67.14(17)^{\circ}$ and $50.74(8)^{\circ}$ with the phenyl ring ( $\mathrm{C} 5 / \mathrm{C} 6 / \mathrm{C} 7 / \mathrm{C} 8 / \mathrm{C} 9 / \mathrm{C} 10$ ) and the mean plane of the carbonyl group ( $\mathrm{C} 3 / \mathrm{C} 4 / \mathrm{C} 5 / \mathrm{O} 1$ ), respectively. The dihedral angle between the phenyl rings ( $\mathrm{C} 5 / \mathrm{C} 6 / \mathrm{C} 7 / \mathrm{C} 8 / \mathrm{C} 9 / \mathrm{C} 10$ ) and $\left(\mathrm{C}^{\mathrm{i}} / \mathrm{C}^{\mathrm{i}} / \mathrm{C}^{\mathrm{i}} / \mathrm{C} 8^{\mathrm{i}} / \mathrm{C} 9^{\mathrm{i}} / \mathrm{C} 10^{i}\right)$ is 82.83 (2) (Macrae et al., 2008), and thus they are almost orthogonal to each other.
The crystal packing is stabilized by $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ intermolecular interactions. The molecules are linked into infinite chains along the $b$ axis via $\mathrm{C} 1-\mathrm{H} 1 \cdots \mathrm{O} 1^{\mathrm{ii}}$ hydrogen bonds, generating the $R^{2}{ }_{2}(10)$ graphset motifs (Bernstein et al., 1995). The symmetry code: (ii) $x,-1+y, z$ (look Table 1). The packing view of the compound is shown in (Fig. 2).

## S2. Experimental

To a stirred suspension of benzo[c]furan, 1,3-bis(4-methylphenyl)-4,7-dihydro-2-benzofuran ( $3 \mathrm{~g}, 9.554 \mathrm{mmol}$ ) in dry THF $(20 \mathrm{ml})$, lead tetra acetate $(4.23 \mathrm{~g}, 9.5 \mathrm{mmol})$ was added and refluxed at 343 K for half an hour. The reaction mixture was then poured into water $(200 \mathrm{ml})$ and extracted with ethyl acetate $(2 \times 20 \mathrm{ml})$, washed with brine solution and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. The removal of solvent in vacuo followed by crystallization from methanol afforded the title compound, (4-methylphenyl) 2 -[(4-methylphenyl)carbonyl]phenyl $\}$ methanone as a colourless solid.

## S3. Refinement

The hydrogen atoms were placed in calculated positions with $\mathrm{C}-\mathrm{H}=0.93-0.96 \AA$ and refined in the riding model with fixed isotropic displacement parameters: $U_{\text {iso }}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{C})$ for methyl atoms and $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$ for the aryl atoms.

Figure 1
The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are shown at $30 \%$ probability level. The H atoms are presented as a small spheres of arbitrary radius. Related atoms have symmetry code: (i) $-x+1, y,-z+3 / 2$.

Figure 2
The crystal packing of the title compound, viewed down $c$ axis, showing molecules linked along $b$ axis. Intermolecular hydrogen bonds are shown in as dashed lines.

## Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$-factors based on ALL data will be even larger.
