Received 5 July 2011; accepted 14 July 2011

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.007 \AA$; disorder in main residue; $R$ factor $=0.077 ; w R$ factor $=0.171$; data-to-parameter ratio $=11.1$.

In the title compound, $\mathrm{C}_{10} \mathrm{H}_{9} \mathrm{Cl}_{2} \mathrm{NO}_{3}$, the conformation of the $\mathrm{N}-\mathrm{H}$ bond in the amide segment is syn with respect to the ortho- Cl atom and anti to the meta- Cl atom of the benzene ring. In the crystal, intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds pack the molecules into two types of chains along the $a$ and $b$ axes, respectively, leading to an overall sheet structure. The acid group in the side chain is disordered and was refined using a split model with site-occupation factors of 0.60:0.40.

## N -(2,5-Dichlorophenyl)succinamic acid

B. S. Saraswathi, Sabine Foro and B. Thimme Gowda

## S1. Comment

The amide and sulfonamide moieties are important constituents of many biologically important compounds. As a part of our studies on the effects of substituents on the structures and other aspects of this class of compounds (Bhat \& Gowda, 2000; Gowda et al., 2003, 2007; Jayalakshmi \& Gowda, 2004; Saraswathi et al., 2011a,b), in the present work, the crystal structure of $N$-(2,5-dichlorophenyl)-succinamic acid (I) has been determined (Fig. 1). The conformation of the N-H bond in the amide segment is syn to the ortho-chloro atom and anti to the meta-chloro atom of the benzene ring, similar to the syn conformation observed between the amide hydrogen and the ortho-methyl group and anti conformation between the amide hydrogen and the meta-methyl group in the benzene ring of $N$-( 2,5 -dimethylphenyl)-succinamic acid monohydrate (II) (Saraswathi et al., 2011a).

Further, the conformations of the amide oxygen and the carboxyl oxygen of the acid segment are syn to each other. But the conformation of the amide $\mathrm{C}=\mathrm{O}$ is anti to the H atoms on the adjacent $-\mathrm{CH}_{2}$ group, while the carboxyl $\mathrm{C}=\mathrm{O}$ is syn to the H atoms on the adjacent $-\mathrm{CH}_{2}$ group.
The $\mathrm{C}=\mathrm{O}$ and $\mathrm{O}-\mathrm{H}$ bonds of the acid group are in syn position to each other, similar to that observed in (II) and in $N$-(2,6-dichlorophenyl)-succinamic acid (Saraswathi et al., 2011b).
The intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, along $a$ - and $b$-axes, respectively, pack the molecules into infinite chains in the structure (Table 1, Fig.2).
The modes of interlinking carboxylic acids by hydrogen bonds is described elsewhere (Leiserowitz, 1976). The packing of molecules involving dimeric hydrogen bonded association of each carboxyl group with a centrosymmetrically related neighbor has also been observed (Jagannathan et al., 1994).

## S2. Experimental

The solution of succinic anhydride ( 0.01 mole ) in toluene $(25 \mathrm{ml})$ was treated dropwise with the solution of 2,5-dichloroaniline ( 0.01 mole ) also in toluene $(20 \mathrm{ml})$ with constant stirring. The resulting mixture was stirred for about one hour and set aside for an additional hour at room temperature for completion of the reaction. The mixture was then treated with dilute hydrochloric acid to remove the unreacted 2,5 -dichloroaniline. The resultant title compound was filtered under suction and washed thoroughly with water to remove the unreacted succinic anhydride and succinic acid. It was recrystallized to constant melting point from ethanol. The purity of the compound was checked and characterized by its infrared and NMR spectra.
Needle like colorless single crystals used in X-ray diffraction studies were grown in ethanolic solution by slow evaporation at room temperature.

## S3. Refinement

The H atom of the NH group was located in a difference map and its position refined with $\mathrm{N}-\mathrm{H}=0.86$ (2) $\AA$. The other H atoms were positioned with idealized geometry using a riding model with the aromatic $\mathrm{C}-\mathrm{H}=0.93 \AA$, methylene $\mathrm{C}-$ $\mathrm{H}=0.97 \AA$ and $\mathrm{O}-\mathrm{H}=0.82 \AA$. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the $U_{\text {eq }}$ of the parent atom).
The atoms $\mathrm{C} 9, \mathrm{C} 10, \mathrm{O} 2$ and O 3 are disordered and were refind using a split model. The corresponding site-occupation factors were fixed to $0.60: 0.40$ and their corresponding bond distances in the disordered groups were restrained to be equal. The $U_{\text {eq }}$ of these atoms were restrained to approximate isotropic behavoir.

185 parameters
54 restraints
Primary atom site location: structure-invariant direct methods

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
