Received 29 June 2011; accepted 13 July 2011

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; disorder in main residue; $R$ factor $=0.050 ; w R$ factor $=0.130$; data-to-parameter ratio $=14.2$.

The asymmetric unit of the title compound, $\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{ClN}_{2} \mathrm{O}_{2}$, contains one half-molecule with a center of inversion at the mid-point of the central $\mathrm{C}-\mathrm{C}$ bond. The amide $\mathrm{N}-\mathrm{H}$ group is anti to the meta-chloro/methyl groups in the adjacent benzene rings. The dihedral angle between the benzene ring and the $\mathrm{NH}-\mathrm{C}(\mathrm{O})-\mathrm{CH}_{2}$ segment is $43.5(1)^{\circ}$. In the crystal, intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules into chains along the $a$ axis. The methyl group and the Cl atom occupy the same position and were treated in a disorder model with site-occupation factors of 0.5 each.

## $N$-(3-Chlorophenyl)- $\mathbf{N}^{\prime}$-(3-methylphenyl)succinamide

B. S. Saraswathi, Sabine Foro and B. Thimme Gowda

## S1. Comment

The amide and sulfonamide moieties are important constituents of many biologically significant compounds. As part of our studies on the substituent effects on the structures of this class of compounds (Bhat \& Gowda, 2000; Gowda et al., 2007; Jayalakshmi \& Gowda, 2004; Saraswathi et al., 2011a,b), in the present work, the structure of $N$-(3-chlorophenyl), $N$-(3-methylphenyl)- succinamide, (I), has been determined (Fig.1). The asymmetric unit of (I) contains half a molecule with a center of inversion at the mid-point of the central $\mathrm{C}-\mathrm{C}$ bond, similar to that observed in bis(2-chlorophenylaminocarbonylmethyl)disulfide, (II), (Pierrot et al., 1984), $N, N$-bis(3-chlorophenyl)-succinamide, (III), (Saraswathi et al., 2011a) and N,N-bis(3-methylphenyl)-succinamide dihydrate, (IV), (Saraswathi et al., 2011b).
The conformations of the amide O atoms are anti to the H atoms attached to the adjacent C atoms. Further, the conformations of the $\mathrm{N}-\mathrm{H}$ bonds in the amide fragments are anti to the meta-chloro/methyl groups in the adjacent benzene rings, similar to the anti conformations observed with respect to the meta-chloro groups in (III) and meta-methyl groups in (IV).
Further, the $\mathrm{C} 1-\mathrm{N} 1-\mathrm{C} 7-\mathrm{C} 8$ and $\mathrm{C} 1 \mathrm{a}-\mathrm{N} 1 \mathrm{a}-\mathrm{C} 7 \mathrm{a}-\mathrm{C} 8 \mathrm{a}$ segments in (I) are nearly planar and so also the $\mathrm{C} 1-\mathrm{N} 1-$ C7-O1 and C1a-N1a-C7a-O1a segments, similar to those observed in (III) and (IV). The torsion angles of C2-C1 $-\mathrm{N} 1-\mathrm{C} 7$ and $\mathrm{C} 6-\mathrm{C} 1-\mathrm{N} 1-\mathrm{C} 7$ are $-43.2(4)^{\circ}$ and $138.6(3)^{\circ}$, in contrast to the values of $-35.0(3)^{\circ}$ and $147.5(2)^{\circ}$ in (III), and 5.4 (9) ${ }^{\circ}$ and -173.6 (6) ${ }^{\circ}$ in (IV).

The dihedral angle between the benzene ring and the $\mathrm{NH}-\mathrm{C}(\mathrm{O})-\mathrm{CH}_{2}$ segment is $43.5(1)^{\circ}$, compared to the values of 62.1 (2) $)^{\circ}$ in (III) and 5.6 (4) ${ }^{\circ}$ in (IV).

The packing of the molecules in the crystal is accomplished by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1) that lead is shown in Fig. 2.

## S2. Experimental

Succinic anhydride $(0.01 \mathrm{~mol})$ in toluene $(25 \mathrm{ml})$ was treated dropwise with 3-chloroaniline $(0.01 \mathrm{~mol})$ also in toluene $(20 \mathrm{ml})$ with constant stirring. The resulting mixture was stirred for one hour and set aside for an additional hour at room temperature for completion of the reaction. The mixture was then treated with dilute hydrochloric acid to remove unreacted 3-chloroaniline. The resultant solid $N$-(3-chlorophenyl)-succinamic acid was filtered under suction and washed thoroughly with water to remove the unreacted succinic anhydride and succinic acid. The compound was recrystallized to a constant melting point from ethanol. The purity of the compound was checked by elemental analysis and characterized by its infrared and NMR spectra.
The $N$-(3-chlorophenyl)succinamic acid obtained was then treated with phosphorous oxychloride and excess of 3methylaniline at room temperature with constant stirring. The resultant mixture was stirred for 4 h , kept aside for additional 6 h for completion of the reaction and poured slowly into crushed ice with constant stirring. It was kept aside for a day. The resultant solid, $N$-(3-chlorophenyl), $N$-(3-methylphenyl)-succinamide was filtered under suction, washed
thoroughly with water, dilute sodium hydroxide solution and finally with water. It was recrystallized to a constant melting point from a mixture of acetone and toluene $(3: 1 \mathrm{v} / \mathrm{v})$. The compound was characterized by its infrared and NMR spectra.

Prism-like colorless single crystals used in X-ray diffraction studies were grown in a mixture of acetone and toluene $(3: 1 v / v)$ at room temperature.

## S3. Refinement

The H atoms were positioned with idealized geometry using a riding model with $\mathrm{C}-\mathrm{H}=0.93 \AA$ for aromatic, $\mathrm{C}-\mathrm{H}=$ $0.97 \AA$ for methylene and $\mathrm{N}-\mathrm{H}=0.86 \AA$ for amide H atoms and were refined with isotropic displacement parameters, set to $1.2 \times U_{\text {eq }}$ of the parent atom. Atoms C9 and Cl1 occupy the same position. The disorder was treated by using a splitatom model. The corresponding site-occupation factors were fixed to $0.50: 0.50$. The $\mathrm{U}^{\mathrm{ij}}$ components of these atoms were restrained to approximate isotropic behavior (Nardelli, 1999), the bond lenghts C3-C9 and C3-Cl1 were restrained.

$$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
