## 2,4-Dioxo-1-(prop-2-ynyl)-1,2,3,4-tetra-hydropyrimidine-5-carbaldehyde

Yan He, Liang-Yan Cui and Xin-Ying Zhang*

School of Chemistry and Environmental Science, Henan Key Laboratory for Environmental Pollution Control, Henan Normal University, Xinxiang, Henan 453007, People's Republic of China
Correspondence e-mail: xyzh518@sohu.com
Received 3 August 2011; accepted 9 August 2011
Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.040 ; w R$ factor $=0.123$; data-to-parameter ratio $=12.9$.

In the crystal structure of the title compound, $\mathrm{C}_{8} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{O}_{3}$, the molecules are linked by a pairs of intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming inversion dimers. The aldehyde group is in the same plane as the pyrimidine ring [with a maximum deviation of 0.083 (2) $\AA$ for the O atom), and the linear propargyl group $\left[\mathrm{C}-\mathrm{C}-\mathrm{C}=178.99(19)^{\circ}\right]$ makes a dihedral angle of $74.36(13)^{\circ}$ with the ring.

## 2,4-Dioxo-1-(prop-2-ynyl)-1,2,3,4-tetrahydropyrimidine-5-carbaldehyde

## Yan He, Liang-Yan Cui and Xin-Ying Zhang

## S1. Comment

Acyclic pyrimidine nucleosides have drawn much attention because of their insteresting structures and broad utilizations as effective drugs for the treatment of diseases caused by herpes simplex virus (HSV) and varizella zoster (VZV) (De Clercq, 2009, 2010a,b). The title compound can be used as a powerful synthon for the preparation of acyclic pyrimidine nucleoside derivatives with potential biological activities due to the rich and extensive chemistry of the aldehyde carbonyl (Fan, 2011). Herein, we report the synthesis and crystal structure of the title compound.
In the title compound, $\mathrm{C}_{8} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{O}_{3}$, all the atoms in the pyrimidine ring, atoms connected directly with the pyrimidine ring and atoms in the aldehyde carbonyl group in the 5-position of the pyrimidine ring are in the same plane, which means there is a big conjugated system in the molecule. The linear structure of the propynyl group is connected with the big plane at an angle of $150.3^{\circ}$. In the crystal structure, the molecules are linked via intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond.

## S2. Experimental

To a solution of $\mathrm{K}_{2} \mathrm{~S}_{2} \mathrm{O}_{8}(16.5 \mathrm{mmol})$ and $\mathrm{CuSO}_{4}(3.2 \mathrm{mmol})$ in $30 \mathrm{ml} \mathrm{H}_{2} \mathrm{O}$ was added a $\mathrm{CH}_{3} \mathrm{CN}$ solution ( 25 ml ) of 5-methyl-1-(prop-2-ynyl)pyrimidine-2,4( $1 \mathrm{H}, 3 \mathrm{H}$ )-dione ( 8 mmol ) and 2,6-lutidine ( 3.2 ml ). The mixture was stirred at 60 ${ }^{\circ} \mathrm{C}$ for 5 h . Upon completion, the mixture was concentrated to half of the initial volume, and the remaining solution was extracted with EtOAc . The organic layer was washed with $\mathrm{H}_{2} \mathrm{O}$. The aqueous layers were combined and back-extracted with $\mathrm{CHCl}_{3}$. Then the organic layers were combined, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and then concentrated. The residue was purified through silica gel column chromatography with a mixture of methylene chloride-methanol $(60: 1, v / v)$ as eluent to give 1,2,3,4-tetrahydro-2,4-dioxo-1-(prop-2-ynyl)- pyrimidine-5-carbaldehyde. Single crystals of the title compound were obtained by slow evaporation of the solvent from a methylene chloride-methanol ( $60: 1 \mathrm{v} / \mathrm{v}$ ) solution.

## S3. Refinement

H atoms were positioned geometrically and refined using riding model, with $\mathrm{C}-\mathrm{H}=0.93$ or $0.97 \AA$, and $\mathrm{N}-\mathrm{H}=0.86 \AA$, and with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C}, \mathrm{N})$.

Figure 1
Molecular structure of the title compound, with displacement ellipsoids drawn at the $30 \%$ probability level.

Figure 2
Crystal packing of the title compound with view along the $a$ axis. Intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds are shown as dashed lines.

## Refinement

## Refinement on $F^{2}$

Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.040$
$w R\left(F^{2}\right)=0.123$
$S=1.08$
1520 reflections
118 parameters
0 restraints
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0694 P)^{2}+0.1695 P\right]$
where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.14 \mathrm{e}^{-3}$
$\Delta \rho_{\text {min }}=-0.23 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes)
are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ factors based on ALL data will be even larger.
