# 2-Methyl-5-nitro-1H-benzimidazol-6amine dihydrate 

Sebla Dinçer, ${ }^{\text {a }}$ Hakan Dal ${ }^{\text {b }}$ and Tuncer Hökelek ${ }^{\text {c* }}$<br>${ }^{\text {a }}$ Ankara University, Department of Chemistry, 06100 Tandoğan, Ankara, Turkey,<br>${ }^{\mathbf{b}}$ Anadolu University, Faculty of Science, Department of Chemistry, 26470<br>Yenibağlar, Eskişehir, Turkey, and ${ }^{\mathrm{c}}$ Hacettepe University, Department of Physics, 06800 Beytepe, Ankara, Turkey<br>Correspondence e-mail: merzifon@hacettepe.edu.tr

Received 8 August 2011; accepted 23 August 2011

Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.043 ; w R$ factor $=0.113$; data-to-parameter ratio $=14.6$.

The title benzimidazole molecule, $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{~N}_{4} \mathrm{O}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, is planar with a maximum deviation of 0.079 (2) $\AA$ (for one of the O atoms in the nitro group). It crystallized as a dihydrate and intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the uncoordinated water molecules, and the nitro and amine groups, respectively. In the crystal, $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}, \mathrm{O}-$ $\mathrm{H} \cdots \mathrm{N}, \mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules to form a three-dimensional network. A $\pi-\pi$ contact between the benzene rings, [centroid-centroid distance $=3.588(1) \AA$ ] may further stabilize the crystal structure.

## 2-Methyl-5-nitro-1 H-benzimidazol-6-amine dihydrate

## Sebla Dinçer, Hakan Dal and Tuncer Hökelek

## S1. Comment

Benzimidazole derivatives are privileged structures in pharmaceutical chemistry because of their biological activities and clinical applications. They exhibit antitumor, anthelmintic, antibacterial, virucidal and fungucidal properties (Refaat, 2010; Laryea et al., 2010; Horton et al., 2003; Spasov et al., 1999; Soula \& Luu-Duc, 1986). In addition to their biological activities, a review of the literature reveals that there are numerous studies including the coordination and corrosion inhibitor abilities of benzimidazoles (Kuznetsov \& Kazansky, 2008; Subramanyam \& Mayanna, 1985). Some of these derivatives, particularly nitro derivatives, are used as photographic materials in photography and on the other hand, the development of the chemistry of the benzimidazole dyes has been remarkable (Hoffmann et al., 2011; Alamgir et al., 2007). As a part of our ongoing investigations of benzimidazole derivatives, the title compound was synthesized and its crystal structure is reported herein.
The title molecule, (Fig. 1), consists of an imidazole ring with $\mathrm{CH}_{3}, \mathrm{NO}_{2}$ and $\mathrm{NH}_{2}$ substituents at positions 2, 5 and 6, respectively. It crystalllized with two uncoordinated water molecules. The intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1) link the uncoordinated water molecules and the $\mathrm{NH}_{2}$ and $\mathrm{NO}_{2}$ groups, respectively. The imidazole ring system is planar with a maximum deviation of -0.010 (2) $\AA$ (for atom C4). Atoms C8, O1, O2, N1 and N2 are 0.032 (2), 0.029 (2), $-0.008(2),-0.001$ (1) and $0.079(2) ~ \AA$ away from the imidazole ring mean plane, respectively.
In the crystal of the title compound $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}, \mathrm{O}-\mathrm{H} \cdots \mathrm{N}, \mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules to form a three-dimensional network (Table 1 and Fig. 2). The $\pi-\pi$ contact between the benzene rings, $\mathrm{Cg} 1-\mathrm{Cg} 1^{\mathrm{i}}$, [symmetry code: (i) $1-\mathrm{x},-\mathrm{y},-\mathrm{z}$, where Cg 1 is the centroid of ring ( $\mathrm{C} 1-\mathrm{C} 6$ )], may further stabilize the structure, with a centroid-centroid distance of 3.588 (1) $\AA$.
The crystal structures of similar benzimidazole derivatives, $\left(\mathrm{C}_{7} \mathrm{H}_{4} \mathrm{~N}_{4} \mathrm{O}_{4}\right) \cdot \mathrm{H}_{2} \mathrm{O}$ (Hökelek et al., 2002) and $\mathrm{C}_{8} \mathrm{H}_{7} \mathrm{~N}_{4} \mathrm{O}_{4}{ }^{+} . \mathrm{Cl}^{-}$ (Dinçer et al., 2011) have been reported.

## S2. Experimental

For the preparation of the title compound, a solution of $\mathrm{Na}_{2} \mathrm{~S} .9 \mathrm{H}_{2} \mathrm{O}(35.0 \mathrm{~g})$ and $\mathrm{S}(9.0 \mathrm{~g})$ in warm water $(150 \mathrm{ml})$ was added slowly to a solution of 2-methyl-5,6-dinitro- $1 H$-benzimidazole ( 30.0 g ) in water $(150 \mathrm{ml}$, ) and the mixture was warmed at 333-343 K for 20 min . After the reaction was completed, the mixture was filtered, acidified with dilute HCl and heated until termination of $\mathrm{H}_{2} \mathrm{~S}$ and $\mathrm{SO}_{2}$ formation. After cooling, the reaction mixture was treated with dilute ammonium hydroxide. The precipitate was filtered and crystallized from ethanol to give red rod-shaped crystals of the the title compound (m.p. 563-565 K).

## S3. Refinement

Atoms H4 (of the NH group), H 21 and H 22 (of the $\mathrm{NH}_{2}$ group), $\mathrm{H} 31, \mathrm{H} 32, \mathrm{H} 41$ and H 42 (of the water molecules) were located in a difference Fourier map and were freely refined. The C-bound H -atoms were positioned geometrically with C
$-\mathrm{H}=0.93$ and $0.96 \AA$, for aromatic and methyl H -atoms, respectively, and constrained to ride on their parent atoms, with $U_{\text {iso }}(\mathrm{H})=\mathrm{k} \times U_{\text {eq }}(\mathrm{C})$, where $\mathrm{k}=1.5$ for methyl H -atoms and $\mathrm{k}=1.2$ for all other H -atoms.

## Figure 1

The molecular structure of the title compound, with the crystallographic labelling scheme and displacement ellipsoids drawn at the $50 \%$ probability level. The $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds are shown as dashed lines (see Table 1 for details).

Figure 2
A view of the crystal packing of the title compound. Hydrogen bonds are shown as dashed lines (see Table 1 for details).

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
Refinement. Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R-factor wR and goodness of fit $S$ are based on $\mathrm{F}^{2}$, conventional R-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>2 \operatorname{sigma}\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors (gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R - factors based on ALL data will be even larger.
