## A second monoclinic polymorph of 2,4-dimethylanilinium chloride

Soudeh Hossein Zadeh, ${ }^{\text {a }}$ Mohamad Reza Talei Bavil Olyai, ${ }^{\text {b }}$ * Hossein Biglari Mazlaghani ${ }^{\text {a }}$ and Behrouz Notash ${ }^{\text {c }}$<br>${ }^{\text {a Department of Chemistry, Islamic Azad University, Karaj Branch, Karaj, Iran, }}$ ${ }^{\mathbf{b}}$ Department of Chemistry, Islamic Azad University, South Tehran Branch, Tehran, Iran, and ${ }^{\text {c }}$ Department of Chemistry, Shahid Beheshti University, G. C., Evin, Tehran 1983963113, Iran<br>Correspondence e-mail: talei3@gmail.com

Received 14 October 2011; accepted 29 October 2011
Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.042 ; w R$ factor $=0.104 ;$ data-to-parameter ratio $=21.7$.

A second monoclinic polymorph of 2,4-dimethylanilinium chloride, $\mathrm{C}_{8} \mathrm{H}_{12} \mathrm{~N}^{+} \cdot \mathrm{Cl}^{-}$, (I), is reported. The unit-cell dimensions differ from those of the first reported monoclinic form, (II) [Yao (2010). Acta Cryst. E66, o1563]. Nevertheless, both compounds crystallize in the monoclinic space group $P 2_{1} / n$. As in (II), the protonated amine group in (I) acts as a hydrogenbond donor to the chloride ion, forming three $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds. The result is a two-dimensional network in the $a c$ plane. The difference in the hydrogen-bond pattern is that in (I) only 12-membered rings are formed whereas in (II), eight-membered and 16 -membered rings are formed.

## A second monoclinic polymorph of 2,4-dimethylanilinium chloride

## Soudeh Hossein Zadeh, Mohamad Reza Talei Bavil Olyai, Hossein Biglari Mazlaghani and Behrouz Notash

## S1. Comment

The combination of organic cations and inorganic anions is important in material science and chemistry because of their abilities to join the properties of organic and inorganic molecules, exhibiting some interesting crystal structures with special properties, such as luminescence, magnetism, and multifunctional properties (Masse et al., 1993). Furthermore these hybrid materials have a great interest due to their numerous varieties of intriguing structural topologies (Xiao et al., 2005).

The title compound, (I), is a second monoclinic polymorph of the structure of 2,4-dimethylanilinium chloride which crystallizes in the space group $P 2_{1} / n$. A different structure, (II), in the space group $P 2_{1} / c$ was described earlier by (Yao, 2010).

The asymmetric unit of the title compound contains one 2,4-dimethylanilinium cation and one chloride anion (Fig. 1). The cell parameters of the current monoclinic polymorph vary significantly from the earlier polymorph $[a=9.4739$ (19) $\AA, b=9.894(2) \AA, c=9.6709(19) \AA$ and $\left.\beta=96.31(3)^{\circ}\right]$. The $\mathrm{C}-\mathrm{N}$ bond length is 1.465 (2) $\AA$. The $\mathrm{C}-\mathrm{N}$ bond length for previous crystal structure was given 1.466 (3) $\AA$ (Yao, 2010). Inside lattice, each $\mathrm{Cl}^{-}$anion is linked to three organic species through $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds (Table 1).
The two-dimensional arrangement of the chloride anions and 2,4-dimethylanilinum cations in the unit cell is shown in Fig. 2.

## S2. Experimental

An ethanolic solution of 2,4-dimethylaniline ( $1.21 \mathrm{~g}, 10 \mathrm{mmol}$ in 10 ml ) was added dropwise to a magnetically stirred of aqueous hydrochloric acid solution $(1.01 \mathrm{~g}, 10 \mathrm{mmol})$ a $1: 1$ molar ratio. The achieved solution is then filtered to eliminate the colorless crystals precipitated formed and then stirred for 2 hrs . After stirring, the obtained solution was slowly evaporated at room temperature over several days resulting in the formation of 2,4-dimethylanilinium chloride crystals.

## S3. Refinement

The hydrogen atoms of the protonated nitrogen were found in difference Fourier map and refined isotropically. The $\mathrm{C}-\mathrm{H}$ protons were positioned geometrically and refined as riding atoms with $\mathrm{C}-\mathrm{H}=0.93 \AA$ and $\operatorname{Uiso}(\mathrm{H})=1.2 U \mathrm{eq}(\mathrm{C})$ for aromatic $\mathrm{C}-\mathrm{H}$ and $\mathrm{C}-\mathrm{H}=0.96 \AA$ and $\operatorname{Uiso}(\mathrm{H})=1.5 \operatorname{Ueq}(\mathrm{C})$ for methyl groups.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
