## 3-Oxo-5-(piperidin-1-yl)-2,3-dihydro-1H-pyrazole-4-carbonitrile

Wedad M. Al-Adiwish, ${ }^{\text {a }}$ W. A. Yaacob, ${ }^{\text {a }}$ D. Adan, ${ }^{\text {a }}$ Mohamed Ibrahim Mohamed Tahir ${ }^{\text {b }}$ and Mohammad B. Kassim ${ }^{\mathbf{a} *}$<br>${ }^{\text {a School of Chemical Sciences and Food Technology, Faculty of Science and }}$ Technology, Universiti Kebangsaan Malaysia, 43600 Selangor, Malaysia, and ${ }^{\text {b }}$ Department of Chemistry, Faculty of Science, Universiti Putra Malaysia, 43400 UPM Serdang, Selangor, Malaysia<br>Correspondence e-mail: mbkassim@ukm.my

Received 13 October 2011; accepted 10 November 2011

Key indicators: single-crystal X-ray study; $T=150 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.057 ; \omega R$ factor $=0.166 ;$ data-to-parameter ratio $=14.2$.

In the title compound, $\mathrm{C}_{9} \mathrm{H}_{12} \mathrm{~N}_{4} \mathrm{O}$, the piperidine ring adopts a chair conformation and makes a dihedral angle of 42.49 (11) ${ }^{\circ}$ with the approximately planar pyrazole moiety [maximum deviation $=0.038(2) \AA]$. In the crystal, $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds and a weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interaction link the molecules into sheets lying parallel to (110).

# 3-Oxo-5-(piperidin-1-yl)-2,3-dihydro-1 H-pyrazole-4-carbonitrile 

Wedad M. Al-Adiwish, W. A. Yaacob, D. Adan, Mohamed Ibrahim Mohamed Tahir and Mohammad B. Kassim

## S1. Comment

In this paper, we report the synthesis and structure of the new derivative of 3-oxo-5-(piperidin-1-yl)-2,3-dihydro-1 H -pyrazole-4-carbonitrile. The compound was obtained by cyclization reaction between ethyl 2-cyano-3-(methyl-thio)-3-(piperidin-1-yl)acrylate and hydrazine.
In the title compound (I), the mean plane of the pyrazole $\mathrm{O} 1 / \mathrm{N} 1 / \mathrm{N} 2 / \mathrm{N} 4 / \mathrm{C} 5 / \mathrm{C} 6 / \mathrm{C} 7 / \mathrm{C} 8 / \mathrm{C} 9$ is essentially planar with maximum deviation of $-0.038(2)^{\circ}$ for C 8 and forms a dihedral angle of $42.49(11)^{\circ}$ with that of the piperidine mean plane $\mathrm{N} 1 / \mathrm{C} 1 / \mathrm{C} 2 / \mathrm{C} 3 / \mathrm{C} 4 / \mathrm{C} 5$ (Fig. $1 \&$ Scheme 1). Consequently, a short non-bonding intra D—H..H—X contact forms between the $\mathrm{N} 2-\mathrm{H} 2$ of the pyrazole and the $\mathrm{H} 5 \mathrm{~B}-\mathrm{C} 5$ of the piperidine moeities.
The carbonyl C8=O1 [1.246(2)] and $\mathrm{C} 6=\mathrm{C} 7[1.407$ (3) $\AA$ ] are longer than the average $[\mathrm{C}=\mathrm{O}(1.200 \AA)]$ and $\mathrm{C}=\mathrm{C}$ $[(1.340 \AA)]$ bond lengths, respectively. Whereas the C6-N2 [1.363 (2) $\AA$ ] and C8—N3 [1.375 (2) $\AA$ ] bond lengths are shorter than the average $\mathrm{C}-\mathrm{N}[(1.47 \AA)]$ indicative of electron-donating effects of the amino groups. Other bond lengths and angle in the molecules are in the normal ranges (Allen et al.,1987).
In the crystal, intermolecular hydrogen bonds $\mathrm{N} 2-\mathrm{H} 2 \cdots \mathrm{O} 4$ and $\mathrm{N} 3-\mathrm{H} 3 \cdots \mathrm{O} 1$ and a weak $\mathrm{C} 4-\mathrm{H} 4 \cdots \mathrm{O} 1$ interaction link the molecules forming a two-dimensional polymeric network parallel to (110) (Fig. 2).

## S2. Experimental

A mixture of ethyl 2-cyano-3-(methylthio)-3-(piperidin-1-yl)acrylate ( 4 mmol ) and hydrazine hydrate ( 4 mmol ) was heated on a water-bath for 2 h . Then, ethanol ( 20 ml ) was added and the mixture was refluxed for another 2 h . The solvent was evaporated and the product was collected, washed with ethanol, and dried. Colourless blocks of (I) were formed by slow evaporation of the compound from ethanol solution. Yield $=90 \%$.

## S3. Refinement

H atoms of both C and N atoms were positioned geometrically and allowed to ride on their parent atoms, with $U_{\mathrm{iso}}=$ $1.2 U_{\text {eq }}(\mathrm{C})$ for $\mathrm{CH}_{2} 0.97 \AA$. Hydrogen atoms attached to N were also positioned geometrically and allowed to ride on their parent atoms and with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{N})$ for $\mathrm{N}-\mathrm{H} 0.86 \AA$.

Figure 1
The molecular structure of (I), with displacement ellipsoids are drawn at the $30 \%$ probability level.

Figure 2
Crystal packing of (I) viewed down the $a$ axis. Hydrogen bonds $[\mathrm{N}-\mathrm{H} \cdots \mathrm{O}(x-1, y, z \&-x+2,-y,-z) \mathrm{N}-\mathrm{H} \cdots \mathrm{N}(x-1, y+$ $1, z)]$ are drawn as dashed lines.

$\Delta \rho_{\min }=-0.61$ e $\AA^{-3}$

## Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems open-flow nitrogen cryostat (Cosier \& Glazer, 1986) with a nominal stability of 0.1 K .
Cosier, J. \& Glazer, A.M., 1986. J. Appl. Cryst. 105107.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
