Received 18 October 2011; accepted 9 November 2011

Key indicators: single-crystal X-ray study; $T=273 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.033 ; w R$ factor $=0.108 ;$ data-to-parameter ratio $=17.9$.

In the title compound, $\mathrm{C}_{8} \mathrm{H}_{7} \mathrm{ClN}_{4} \mathrm{~S}_{2}$, the thiazole ring is essentially planar [r.m.s. deviation $=0.0011(2) \AA$ ] and conformation of the thiazolidine ring is twisted on the $\mathrm{C}-\mathrm{C}$ bond. The $\mathrm{C}=\mathrm{N}$ bond has a $Z$ configuration.

## Related literature

The title compound was synthesized as an intermediate for the preparation of pesticides. For the biological activity of this class of compounds, see: Zhang et al. (2000); Kagabu et al. (2008). For the synthesis, see: Kozo et al. (1987); Zuo et al. (2008). For a related structure. see Li et al. (2010).

## S1. Comment

It is already known that certain cyanoimino-subsitituted heterocyclic compounds are useful as intermediates in the preparation of pesticides which have played a major role in eliminating insects such as aphids, leafhoppers and whiteflies (Kagabu et al., 2008; Zhang et al., 2000). The molecular structure of the title compound is shown in Fig. 1. The thiazole ring is essentially planar (r.m.s. deviations $0.0011(2) \AA$ ) and the thiazolidine ring is is in a slight half-chair conformation. The $\mathrm{C}=\mathrm{N}$ bond with a $Z$ configuration has a bond length of $1.150(4) \AA$, which is in agreement with that in a related structure (Li et al., 2010).

## S2. Experimental

The synthesis of the title compound follows the method of Kozo et al. (1987) and Zuo, et al. (2008). (Z)-2-(1,3-Thia-zolidin-2-ylidene)cyanamide $12.7 \mathrm{~g}(0.1 \mathrm{~mol})$ and potassium carbonate $41.4 \mathrm{~g}(0.3 \mathrm{~mol})$ were dissolved in $N, N$-dimethylformamide (DMF) ( 75 ml ), then 2-chloro-5-thiazolylmethyl chloride $17.4 \mathrm{~g}(0.102 \mathrm{~mol})$ dissolved in DMF ( 40 ml ) was added dropwise. The mixture was stirred for 0.5 h at room temperature and filtered. The filtrate was concentrated and further purified by column chromatography to obtain the title product ( 13.9 g ) with a yield of $53.7 \%$ Colorless crystals were obtained by slow evaporation of a tetrahydrofuran solution of the title compound at room temperature.
${ }^{1} \mathrm{H}$ NMR (300 MHz, DMSO-d6): $\delta$ (p.p.m.) $7.71(1 \mathrm{H}, \mathrm{s}), 4.79(2 H$, s), $3.92(2 H, \mathrm{t}, J=15.3 \mathrm{~Hz}, J=7.65 \mathrm{~Hz}) ; 3.49(2 H$, $\mathrm{t}, J=15.3 \mathrm{~Hz}, J=7.65 \mathrm{~Hz})$.

## S3. Refinement

All H atoms were placed in calculated positions, with $\mathrm{C}-\mathrm{H}=0.93-0.97 \AA$ and included in the final cycles of refinement using a riding model, with $\operatorname{Uiso}(\mathrm{H})=1.2 U \mathrm{eq}(\mathrm{C})$.

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.033$
$w R\left(F^{2}\right)=0.108$
$S=0.98$
2440 reflections
136 parameters
0 restraints
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0632 P)^{2}+0.5077 P\right]$ where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\text {max }}=0.38 \mathrm{e} \AA^{-3}$
$\Delta \rho_{\text {min }}=-0.27 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
