## 1,3-Dicyclohexylimidazolidine-2,4,5trione

Oualid Talhi, ${ }^{\text {a }}$ José A. Fernandes, ${ }^{\text {b }}$ Diana C. G. A. Pinto, ${ }^{\text {a }}$ Artur M. S. Silva ${ }^{\text {a }}$ and Filipe A. Almeida Paz ${ }^{\text {b }}$ *<br>${ }^{\text {a }}$ Department of Chemistry, University of Aveiro, QOPNA, 3810-193 Aveiro, Portugal, and ${ }^{\text {b }}$ Department of Chemistry, University of Aveiro, CICECO, 3810-193 Aveiro, Portugal<br>Correspondence e-mail: artur.silva@ua.pt, filipe.paz@ua.pt

Received 29 October 2011; accepted 2 November 2011
Key indicators: single-crystal X-ray study; $T=150 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.017 \AA$; $R$ factor $=0.106 ; w R$ factor $=0.320 ;$ data-to-parameter ratio $=8.6$.

The title compound, $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{3}$, has been isolated as a byproduct of an oxidative cleavage of the $\mathrm{C}-\mathrm{C}$ bond linking two five-membered rings of 1,3-dicyclohexyl-5-(3-oxo-2,3-dihydro-benzofuran-2-yl)imidazolidine-2,4-dione. Individual molecular units are engaged in weak $\mathrm{C}=\mathrm{O} \cdots \mathrm{C}=\mathrm{O}$ interactions $[\mathrm{O} \cdots \mathrm{C}=2.814(10)$ and $2.871(11) \AA$ ], leading to the formation of supramolecular chains which close pack, mediated by van der Waals contacts, in the $b c$ plane.

## 1,3-Dicyclohexylimidazolidine-2,4,5-trione

Oualid Talhi, José A. Fernandes, Diana C. G. A. Pinto, Artur M. S. Silva and Filipe A. Almeida Paz

## S1. Comment

From the old literature we emphasize a handful of descriptions reporting the synthesis of parabanic acid (imidazolidine-2,4,5-trione, 1, Fig. 1) and derivatives. Among the reported synthetic methodologies, this heterocyclic compound can be prepared by the condensation of urea with diethyl oxalate in an ethanolic solution of sodium ethoxide (Murray, 1957; 1963). The synthesis of 1,3-disubstituted parabanic acid derivatives have been reported in a similar fashion, starting from 1,3-dialkylureas and following different pathways. The reaction of oxalyl chloride with 1,3-dialkylureas affords the 1,3-disubstituted parabanic skeleton upon cyclization. In other cases, the action of oxalyl chloride on carbodiimides has led to 2,2-dichloro-1,3-disubstituted imidazolidine-4,5-diones, which produced the parabanic structure after hydrolysis (Ulrichan \& Sayigh, 1965). Furthermore, 3-substituted-5,5-dichlorooxazolidine-2,4-diones were obtained from the reaction of alkyl, aryl, and benzyl isocyanates with oxalyl chloride, giving in high yields the corresponding imidazolidine-2,4,5-triones after treatment with aniline (Richter et al., 1984). The selectivity of the direct mono- and di-$N$-substitution of parabanic acid has also been discussed in the literature (Orazi et al., 1977; Zarzyka-Niemiec \& Lubczak, 2004). Concerning biological applications, several novel patented forms of parabanic acid derivatives and salts have shown interesting activities such as human AMPK activating, blood glucose-lowering and in vivo lipid-lowering activities. In this context, several therapeutic agents containing these compounds as the active principle are, for example, useful drugs in the treatment of diabetic complications (Sato et al., 2011; Kotani et al., 1997; Ishii et al., 1991). In the present study, we describe the crystal structure of 1,3-dicyclohexylparabanic acid (3) (Fig. 1) (Ulrichan \& Sayigh, 1965) which has been isolated via a completely different procedure which consists of an oxidative cleavage of the $\mathrm{C}^{\prime}-\mathrm{C} 5$ single bond of 1,3-dicyclohexyl-(3-oxo-2,3-dihydrobenzofuran-2-yl)imidazolidine-2,4-dione (2) (Fig. 1), previously prepared in a two-step reaction involving the action of dicyclohexylcarbodiimide (DCC) on chromone-2-carboxylic acid (Talhi et al., unpublished data).
The title compound (3) has recently been prepared and tested against cell lines modeling amyotrophic lateral sclerosis (Xia et al., 2011), but its crystal structure remains unpublished. Following our interest on the structural features of compounds with biological activity (Fernandes et al., 2010, 2011; Loughzail et al. 2011) here we wish to report the crystal structure of (3).
The asymmetric unit comprises a whole molecule (3, Fig. 2). The two cyclohexane substituent groups appear to exhibit chair conformations and their medium planes are almost perpendicular (ca 81 and $87^{\circ}$ ) with the medium plane of the central imidazolidine ring. The crystal packing is mainly driven by the need to effectively fill the available space in conjunction with several weak interactions, namely $\mathrm{C}=\mathrm{O} \cdots \mathrm{C}=\mathrm{O}$ : one O 2 atom interacts with two vicinal carbonyl carbon atoms ( C 2 and C 3 ) of a neighboring molecule [ $\mathrm{d}_{\mathrm{O} \ldots \mathrm{C}}$ of 2.814 (10) and 2.871 (11) $\AA$, dashed green lines in Fig. 3]. These weak interactions contribute to the formation of a zigzag columnar arrangement of the molecular units parallel to the $a$
axis of the unit cell. Columns close pack in the $b c$ plane in a typical brick-wall type fashion (Fig. 4).

## S2. Experimental

NMR spectra were recorded on a Bruker Avance 300 spectrometer ( 300.13 for ${ }^{1} \mathrm{H}$ and 75.47 MHz for ${ }^{13} \mathrm{C}$ ), with $\mathrm{CDCl}_{3}$ used as solvent. Chemical shifts $(\delta)$ are reported in p.p.m. and coupling constants $(J)$ in Hz. The internal standard was TMS. Unequivocal ${ }^{13} \mathrm{C}$ assignments have been performed with the aid of two-dimensional HSQC and HMBC experiments (delays for one bond and long-range $J_{\text {C/H }}$ couplings were optimized for 145 and 7 Hz , respectively).
All chemicals were purchased from commercial sources and used as received. 1,3-Dicyclohexyl-(3-oxo-2,3-dihydro-benzofuran-2-yl)imidazolidine-2,4-dione (2) was prepared according to the literature (Talhi et al., 2011).
Iodine ( $8.63 \mathrm{mg}, 0.034 \mathrm{mmol}$ dissolved in 1 ml of DMSO) was added to a solution of $2(0.27 \mathrm{~g}, 0.681 \mathrm{mmol}$ ) in DMSO $(2 \mathrm{ml})$. The reaction was refluxed in a sand bath for 30 minutes. After this period, the solution was poured into ice ( 5 g ) and water $(10 \mathrm{ml})$, leading to the formation of a yellow precipitate. The solid was collected by filtration, washed with water and dissolved in dichloromethane ( 30 ml ). This organic solution was washed with a saturated sodium thiosulfate solution ( $2 \times 200 \mathrm{ml}$ ) and finally purified by silica gel column chromatography using dichloromethane as eluent. The resulting compound was recrystallized from ethanol to give bright-yellow crystals of the title compound (Richter et al., 1984).

1,3-Dicyclohexylimidazolidine-2,4,5-trione, 3, $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{MW}: 278.35\left(0.033 \mathrm{~g}\right.$, yield $17{ }^{\circ}$ ). ${ }^{1} \mathrm{H}$ NMR ( 300.13 MHz , $\mathrm{CDCl}_{3}$ ): $\delta=1.24-2.28\left(\mathrm{~m}, 20 \mathrm{H},-\mathrm{CH}_{2}-\mathrm{H}-2^{\prime}, \mathrm{H}-2^{\prime \prime}, \mathrm{H}-3^{\prime}, \mathrm{H}-3^{\prime \prime}, \mathrm{H}-4^{\prime}, \mathrm{H}-4^{\prime \prime}\right), 4.00\left(\mathrm{tt}, J=12.0,3.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}-1^{\prime}, \mathrm{H}-1^{\prime \prime}\right)$ ppm. ${ }^{13} \mathrm{C}$ NMR ( $75.47 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=25.1$ (C-4', C-4"), $25.6\left(\mathrm{C}-3^{\prime}, \mathrm{C}-3^{\prime \prime}\right), 29.5\left(\mathrm{C}-2^{\prime}, \mathrm{C}-2^{\prime \prime}\right), 52.2\left(\mathrm{C}-1^{\prime}, \mathrm{C}-1^{\prime \prime}\right), 153.3$ (C-4, C-5), 153.8 (C-2) ppm.

## S3. Refinement

Hydrogen atoms bound to carbon were placed in idealized positions with $\mathrm{C}-\mathrm{H}=1.00$ (for methine- H ) and $0.99 \AA$ (for methylene-H). These atoms were included in the final structural model in riding-motion approximation with the isotropic thermal displacement parameters fixed at $1.2 \times U_{\mathrm{eq}}$ of the carbon atom to which they are attached.
The cyclohexane rings are severely affected by disorder. Attempts to model this disorder proved to be unsuccessful hence, the large electron residual density surrounding these moieties: the largest peak and hole, 0.74 and $-0.42 \mathrm{e} \cdot \AA^{-3}$, are located at 0.92 and $0.40 \AA$, respectively, from the C10 atom.
In the absence of significant anomalous scattering effects, 1098 Friedel pairs were averaged in the final refinement.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
