Received 29 October 2011; accepted 21 November 2011
Key indicators: single-crystal X-ray study; $T=150 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.024 ; w R$ factor $=0.070 ;$ data-to-parameter ratio $=20.7$.

In the title compound, $\left[\mathrm{CuCl}_{2}\left(\mathrm{C}_{8} \mathrm{H}_{9} \mathrm{~N}_{3} \mathrm{O}\right)\right]$, the $\mathrm{Cu}^{\text {II }}$ atom has a distorted square-pyramidal $\mathrm{CuCl}_{2} \mathrm{~N}_{2} \mathrm{O}$ coordination geometry. The tridentate acetohydrazide ligand occupies three basal positions, the fourth basal position being defined by a chloride anion at a distance of 2.2116 (6) $\AA$. The second chloride anion is in the apical position and forms a longer $\mathrm{Cu}-\mathrm{Cl}$ distance of 2.4655 (7) A. Intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds are present in the crystal, leading to the formation of chains along [10 $\overline{1}]$.

## Dichlorido $\left\{N^{\prime}-\left[(\right.\right.$ pyridin-2-yl)methylidene- $\kappa N]$ acetohydrazide- $\left.\kappa^{2} N^{\prime}, O\right\}$ copper(II)

Amitabha Datta, Shiann-Cherng Sheu, Pei-Hsin Liu and Jui-Hsien Huang

## S1. Comment

In the title compound (Fig. 1), the copper(II) ion exhibits a distorted square pyramidal geometry. The $N^{\prime}$-(pyridine-2-ylmethylene)acetohydrazide ligand is in its keto form as indicated by the short $\mathrm{C}-\mathrm{O}$ distance of 1.235 (2) $\AA$ and defines three of the basal positions via the pyridyl N , imine N , and keto O atoms. The fourth basal position is provided by a chloride anion, trans to the imine N atom. Another chloride ligand occupies the apical position. The two $\mathrm{Cu}-\mathrm{Cl}$ distances are unequal in length. The chloride ligand in the apical position forms a long $\mathrm{Cu}-\mathrm{Cl}$ bond of 2.4655 (7) $\AA$, whereas the $\mathrm{Cu}-\mathrm{Cl}$ bond to the basal chloride anion is much shorter (2.2116(6) $\AA$ ).
Classical intermolecular hydrogen bonds of the type $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ are present along the [10 $\overline{1}]$ direction (Fig. 2), leading to the formation of chains.
The structure of a copper(II) dichloride complex with a similar tridentate hydrazone ligand has been reported in the literature (Datta, et al., 2011). For other related copper(II) complexes with similar tridentate ligands, see: Sen et al. (2005, 2007a,b), Ray et al. (2008a,b), Recio Despaigne et al. (2009); Datta et al. (2010a,b).

## S2. Experimental

The tridentate acetohydrazide ligand precursor was prepared according to the literature procedure (Ray et al., 2008b). To a hot methanolic solution $(20 \mathrm{ml})$ of anhydrous $\mathrm{CuCl}_{2}(0.134 \mathrm{~g}, 1.0 \mathrm{mmol})$, the ligand $(0.163 \mathrm{~g}, 1.0 \mathrm{mmol})$ was added, which produced immediately an intensely green solution. The mixture was then heated to boiling. On cooling to room temperature and after slow evaporation of the green solution, dark green rectangular shaped single crystals of the complex were separated out after 3 days. The crystals were filtered off and washed with water and dried in air.

## S3. Refinement

Carbon- and nitrogen-bound $\mathrm{H}-$ atoms were placed in calculated positions $(\mathrm{C}-\mathrm{H} 0.95$ to $0.98 \AA$ and $\mathrm{N}-\mathrm{H} 0.88 \AA)$ and were included in the refinement in the riding model approximation, with $U_{\text {iso }}(\mathrm{H})$ set to 1.2 and 1.5 times $U_{\text {eq }}(\mathrm{C}, N)$.

Figure 1
The molecular structure of the title complex, showing $50 \%$ displacement ellipsoids.

Figure 2
Packing diagram of the title compound as viewed down the $a$ axis. Intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds are shown as dashed lines.

$\Delta \rho_{\text {min }}=-0.35$ e $\AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
