## 4-[3-(Isonicotinoyloxy)propoxycarbonyl]pyridinium diiodidoargentate(I)

Javier Vallejos, ${ }^{\text {a }}$ Iván Brito, ${ }^{\text {a }}$ Alejandro Cárdenas, ${ }^{\text {b }}$ Michael Bolte ${ }^{c}$ and Matías López-Rodríguez ${ }^{\text {d }}$<br>${ }^{\text {a }}$ Departamento de Química, Facultad de Ciencias Básicas, Universidad de Antofagasta, Casilla 170, Antofagasta, Chile, ${ }^{\text {b }}$ Departamento de Física, Facultad de Ciencias Básicas, Universidad de Antofagasta, Casilla 170, Antofagasta, Chile, ${ }^{\mathrm{c}}$ Institut für Anorganische Chemie der Goethe-Universität Frankfurt, Max-von-LaueStrasse 7, D-60438 Frankfurt am Main, Germany, and dnstituto de Bio-Orgánica 'Antonio González', Universidad de La Laguna, Astrofísico Francisco Sánchez N ${ }^{\circ} 2$, La Laguna, Tenerife, Spain.<br>Correspondence e-mail: ivanbritob@yahoo.com

Received 3 November 2011; accepted 8 November 2011

Key indicators: single-crystal X-ray study; $T=173 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.006 \AA$; disorder in solvent or counterion; $R$ factor $=0.041 ; w R$ factor $=0.119$; data-toparameter ratio $=17.4$.

The structure of the title compound, $\left(\mathrm{C}_{15} \mathrm{H}_{15} \mathrm{~N}_{2} \mathrm{O}_{4}\right)\left[\mathrm{AgI}_{2}\right]$, consists of an organic 4-[3-(isonicotinoyloxy)propoxycarbonyl]pyridinium cation which has a gauche-gauche $(\mathrm{O} / \mathrm{C} / \mathrm{C} / \mathrm{C}-$ $\mathrm{O} / \mathrm{C} / \mathrm{C} / \mathrm{C}$ or $\mathrm{GG}^{\prime}$ ) conformation and lies on a twofold rotation axis, which passes through the central C atom of the aliphatic chain, and an inorganic $\left[\mathrm{AgI}_{2}\right]^{-}$anion. In the complex anion, the $\mathrm{Ag}^{+}$cation is bound to two $\mathrm{I}^{-}$anions in a linear geometry. The anion was modelled assuming disorder around a crystallographic inversion centre near the location of the $\mathrm{Ag}^{+}$cation. The crystal packing is stabilized by a strong intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond, which links the cations into zigzag chains with graph-set notation $C(16)$ running along the face diagonal of the $a c$ plane. The N -bound H atom is disordered over two equally occupied symmetry-equivalent sites, so that the molecule has a pyridinium ring at one end and a pyridine ring at the other.

## S1. Comment

The design of polymeric organic-inorganic materials with novel topologies and structural motifs is of current interest in the field of coordination chemistry (Blake et al., 1999). This paper forms part of our continuing study of the synthesis, structural characterization and physical properties of coordination polymers (Brito et al., 2011, Albanez et al., 2011). The title compound, (I), was isolated during attempts to synthesize a coordination polymer by a self-assembly reaction between propane-1,3-diyl bis(pyridine-4-carboxylate) and AgI. The structure of the title compound, (I) consist of an organic 4- $\{[3$-isonicotinoyloxy)propoxy]carbonyl $\}$ pyridinium cation which has a gauche-gauche $(\mathrm{O} / \mathrm{C} / \mathrm{C} / \mathrm{C}-\mathrm{O} / \mathrm{C} / \mathrm{C} / \mathrm{C}$ or $\mathrm{GG}^{\prime}$ ) conformation (Carlucci et al., 2002) and lies on a twofold rotation axis, which passes through the central C atom of the aliphatic chain, and an inorganic $\left(\mathrm{AgI}_{2}\right)^{-}$anion, Fig , 1. In the anion, each silver atom is bound to two iodine atoms in a linear geometry. The anion was modelled assuming disorder around a crystallographic inversion centre near the location of the silver atom. The crystal packing is stabilized by a strong intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond, which links the cations into zigzag chains with graph-set notation $\mathrm{C}(16)$ (Bernstein et al., 1995) running along the face diagonal of the $a c$ plane (Fig. 2 and Table 1). There are only slight variations in the geometrical and conformational parameters between the cation complex of (I) and the unprotonated compound (Brito et al., 2010), (II) so when both compounds are superimposed all related atoms fit within an RMSD of $0.0810 \AA$, Fig. 3 (Macrae et al., 2008).

## S2. Experimental

A solution of $\mathrm{AgI}(23.5 \mathrm{mg}, 0.1 \mathrm{mmol})$ in water was slowly added to a solution of propane-1,3-diyl bis(pyridine-4carboxylate) ( $28.6 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) in acetonitrile ( 4 ml ), in presence of an excess of KI. Red single crystals suitable for Xray analysis were obtained after a few days. Only a few single crystals were obtained due to low yield of the reaction, and no spectroscopic data were recorded.

## S3. Refinement

H atoms were located in a difference map but finally geometrically positioned and refined using a riding model with fixed individual displacement parameters $\left[U_{\text {iso }}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C}, \mathrm{N})\right.$ and with $\mathrm{C}_{\text {aromatic }}-\mathrm{H}=0.95 \AA, \mathrm{~N}-\mathrm{H}=0.88 \AA$ and $\mathrm{C}_{\text {methylene }}-$ $\mathrm{H}=0.99 \AA]$. The H atom bonded to N is disordered over two equally occupied sites. The $\left(\mathrm{AgI}_{2}\right)^{-}$anion was modelled assuming disorder around an inversion center. Reflections (1112) and (004), were omitted due to their large disagreement between Fobs and Fcalc.

Figure 1
The molecular structure of (I), showing symmetry-complete molecules. Displacement ellipsoids are drawn at the 50\% probability level. Symmetry operator for generating equivalent atoms: (A) ( $-x, y, 3 / 2-z$ ). The two equally occupied components of the disordered $\mathrm{AgI}_{2}$ anion are drawn will full and open bonds.(symmetry code: $\mathrm{A}:-\mathrm{x},-\mathrm{y}+1,-\mathrm{z}+1$ ).

Figure 2
Packing diagram of the title compound, with a view approximately along the $b$ axis. $N — H \cdots N$ hydrogen bonds are shown as dashed lines, and H atoms not involved in these interactions have been omitted. For clarity, only one of the disordered components of the $\mathrm{AgI}_{2}$ anions is shown.

$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\max }=1.23$ e $\AA^{-3}$
$\Delta \rho_{\text {min }}=-0.76$ e $\AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
